recognized as the cornerstone of the Plastics Industry in the early twentieth century and phenolic resins continue to flourish after a century of robust growth. On July 13, 1907, Baekeland led his heat and pressure patent related to the processing of phenol formaldehyde resins and identified their unique utility in a plethora of applications. The year 2010 marks the Centennial Year of the production of phenolic resins by Leo Baekeland. In 1910, Baekeland formed Bakelite GmbH and launched the manufacture of phenolic resins in Erkner. In May 1910, In October 1910, General Bakelite began producing resins in Perth Amboy, New Jersey. Lastly, Baekeland collaborated with Dr. Takamine to manufacture phenolic resins in Japan in 1911. These events were instrumental in establishing the Plastics Industry and in tracing the identity to the brilliance of Dr. Leo Baekeland. Phenolic resins remain as a versatile resin system featuring either a stable thermoplastic novolak composition that cures with a latent source of formaldehyde hexa or a heat reactive and perishable resole composition that cures thermally or under acidic or special basic conditions. Phenolic resins are a very large volume resin system with a worldwide volume in excess of 5 million tons/year and its growth is related to the gross national product (GNP) growth rate globally.

**Biorefineries** compiles the basic science and technologies used to convert terrestrial and aquatic biomass into essential molecular compounds and polymeric materials. The book provides in-depth insights into this fairly recent concept of industrial chemistry that aims to achieve optimal economic profits while minimizing the environmental impact. Chapters written by renowned experts cover amongst others the application of catalysis, downstream processing, biomass sourced olefins, lignin biorefinery techniques and biogas. The authors thoroughly examine and explain the value chain for biomass conversion into platform molecules and their transformation into final products. A comprehensive thematic overview on the topic giving beginners access to fundamental concepts is presented. Supplemented by numerous full color figures and tables, the contents impart knowledge about the involved techniques. Advanced students and experts in the field will find the summary of state of the art research and current literature of valuable interest. Explores the enormous potential of biomass conversion as a future source for fuels and chemicals. Focuses on both general scientific background and current innovations in the field of biorefinery. Targets students and researchers in Chemistry, Chemical Engineering, Biotechnology and Materials Science. About the Editors: Prof. Michele Aresta, Chair of the Scientific Committee of CIRCC in Italy and holds the IMM Chair at the Department of Chemical and Biomolecular Engineering at NUS Singapore. He is author of over 200 papers and Author or Editor of nine books. Prof. Angela Dibenedetto, Associate Professor at the Department of Chemistry of the University of Bari, Italy, focused on carbon dioxide utilization by applying biorefinery concepts and Director of the Interuniversity Consortium on Chemical Reactivity and Catalysis (CIRCC). Prof. Franck Dumeignil, Deputy Director of the CNRS joint Unit of Catalysis and Chemistry of Solid (UCCS) of Lille University, France, project coordinator of several projects on chemistry including the EuroBioRef Project for designing next generation
