Retinal Muller Cell Structure And Function:

The Retinal Müller Cell Vijay Sarthy,Harris Ripps,2001-04-30 This monograph examines the role of the Müller cell the main glial element of the retina in the development organization and function of the vertebrate retina These cells may also play a role in the control of eye growth and in determining the processing of information by surrounding neurons

The Retinal Müller Cell Vijay Sarthy,Harris Ripps,2005-12-08 The human brain contains more than a billion neurons which interconnect to form networks that process store and recall sensory information These neuronal activities are supported by a group of accessory brain cells collectively known as neuroglia Surprisingly glial cells are ten times more numerous than neurons and occupy more than half the brain volume Hydn 1961 Although long considered a passive albeit necessary component of the nervous system many interesting and unusual functional properties of glial cells are only now being brought to light As a result the status of these cellular elements is approaching parity with nerve cells as a subject for experimental study The term glia or glue seems today to be a misnomer in view of the diverse functions attributed to glial cells Experimental studies in the last three decades have clearly established that the behavior of glial cells is far from passive and that they are at least as complex as neurons with regard to their membrane properties In addition glial cells are of importance in signal processing cellular metabolism nervous system development and the pathophysiology of neurological diseases The Müller cell of the vertebrate retina provides a splendid example of an accessory cell that exhibits features illustrating every aspect of the complex behavior now associated with glial cells

na Andreas Reichenbach,Andreas Bringmann,2011-02-18 Müller cells make up just 0.005% of the cells in our central nervous system They do not belong to the more esteemed family of neuronal cells but to the glia a family of cells that until recently were seen as mere filling material between the neurons Now however all that has changed Sharing the insights of more than a quarter century of research into Müller cells Drs Andreas Reichenbach and Andreas Bringmann of Leipzig University make a compelling case for the central role Müller cells play Everyone agrees that the eye is a very special and versatile sense organ yet it has turned out in recent years that Müller cells are peculiar and multipotent glial cells In the retina of most vertebrates and even of many mammals Müller cells are the only type of macroglial cells thus they are responsible for a wealth of neuron supportive functions that in the brain rely upon a division of labour among astrocytes oligodendrocytes and ependymal cells Even beyond such a role in the central nervous system as model glia Müller cells are adapted to several exciting roles in support of vision They deliver the light stimuli to the photoreceptor cells in the inverted vertebrate retina aid the processing of visual information and are responsible for the homeostatic maintenance of the retinal extracellular milieu In Müller Cells in the Healthy and Diseased Retina aimed not just at neurobiologists but at anyone concerned with retinal degeneration every angle of Müller cells is covered from an introduction to their basic properties through their roles as light cables and shock absorbers to the part they play in diseases and disorders of the eye Once these have all been covered in detail the authors move on to discuss the future direction of

research into these small but potent cellular phenomena About the Authors Dr Andreas Reichenbach was born in 1950 in Leipzig Germany He studied medicine and specialized as a physiologist working on the mammalian retina Since 1984 he has focused his efforts and those of a growing number of fellows in his team on Müller cell research He has held a professorship at Leipzig University since 1994 After studying biology Dr Andreas Bringmann 1960 worked in the field of systemic neurophysiology until he was inspired in 1996 by Andreas Reichenbach to research the most interesting cell the Müller cell He is now in the Department of Ophthalmology of the University of Leipzig where he is the head of the Basic Research Laboratory

The Fovea Andreas Bringmann, Peter Wiedemann, 2021-08-28 The Fovea Structure Function Development and Disease summarizes the current biological knowledge regarding the two types of the vertebrate fovea and its main structural elements the Müller cells This information is then used to explain different aspects of human vision foveal development and macular disorders Sections give an overview of the retinal structure and the different types of retinal glia survey the structure and function of the primate and non mammalian fovea types discuss foveal development with a focus on the human fovea cover the roles of Müller cells and astrocytes in the pathogenesis and regeneration of various human macular disorders are described Using a translational approach this reference is a valuable text for scientists clinicians and physicians interested in the fovea Readers will gain a new understanding of the cellular basics of the fovea which is the most important part of the eye Adopts a translational approach summarizing the biological knowledge regarding the structure and function of the fovea the roles of Müller cells in mediating the structural integrity and function of the fovea Provides overviews of both basic types of the vertebrate fovea countering the popular belief that there is only one type of the vertebrate fovea the human fovea Thoroughly shows the mechanisms involved in the development of the fovea that explain the rapid improvement of visual acuity in newborns Explains pathological changes in the foveal structure and function with evaluation pointing toward possible prevention and or cure

Retinal Glia Andreas Reichenbach, Andreas Bringmann, 2015-02-01 In 1851 Heinrich Müller discovered what he called radial fibers and what we now call Müller cells as the principal glial cells of the vertebrate retina Later on other glial cell types were found in the retina including astrocytes microglia and even oligodendrocytes It turned out that retinal glial cells are essential constituents of the tissue For instance Müller cells appear to constitute the core of columnar units of clonally and functionally related groups of neurons Their primary function is to support neuronal functioning by guiding the light towards the photoreceptor cells removing excess neurotransmitter molecules from extracellular space and performing efficient clearance of excess extracellular potassium ions The latter two functions are also crucial for neuronal survival and are coupled to water clearance which is also essential Müller cells are capable of sensing neuronal activity and modifying it by the release of signal substances gliotransmitters In cases of retinal injuries the Müller cells become reactive and all above mentioned functions are impaired However such de differentiated Müller cells may proliferate and may even serve as stem cells for the regeneration of a damaged retina As well as the Müller cells retinal astrocytes and microglial cells are important players in retinal development and function This book gives a comprehensive survey of the present knowledge on retinal glia

Handbook of Nutrition, Diet, and the Eye Victor R Preedy, 2014-04-01 The Handbook of Nutrition Diet and the Eye is the first book to thoroughly address common features and

etiological factors in how dietary and nutritional factors affect the eye The ocular system is perhaps one of the least studied organs in diet and nutrition yet the consequences of vision loss can be devastating One of the biggest contributors to complete vision loss in the western hemisphere is diabetes precipitated by metabolic syndrome In some developing countries micronutrient deficiencies are major contributory factors to impaired vision However there are a range of ocular defects that have either their origin in nutritional deficiencies or excess or have been shown to respond favorably to nutritional components The eye from the cornea to the retina may be affected by nutritional components Effects may be physiological or molecular This book represents essential reading for nutritionists dietitians optometrists ophthalmologists opticians endocrinologists and other clinicians and researchers interested in eye health and vision in general Saves clinicians and researchers time in quickly accessing the very latest details on a broad range of nutrition ocular health and disease issues Provides a common language for nutritionists nutrition researchers optometrists and ophthalmologists to discuss how dietary and nutritional factors and related diseases and syndromes affect the eye Preclinical clinical and population studies will help nutritionists dietitians and clinicians map out key areas for research and further clinical recommendations

Neural Stem Cells Luca Bonfanti, 2013-04-24 Twenty years after the discovery of neural stem cells the question whether the central nervous system can be considered among regenerative tissues is still open On one side deep characterization of neural stem and progenitor cells their niches and their progeny in brain neurogenic sites overtly showed that new neurons can be generated in the brain of adult mammals including humans On the other side many problems arise when stem cells encounter the mature brain parenchyma still hampering the development of efficacious therapeutic approaches with endogenous or exogenously delivered neural stem cells This book tries to make the point on these extremely
