Principles Of Molecular Recognition:

Principles of Molecular Recognition A.D. Buckingham,A.C. Legon,S.M. Roberts,2012-12-06 The importance of molecular recognition in chemistry and biology is reflected in a recent upsurge in relevant research promoted in particular by high profile initiatives in this area in Europe the USA and Japan Although molecular recognition is necessarily microscopic in origin its consequences are de facto macroscopic Accordingly a text that starts with intermolecular interactions between simple molecules and builds to a discussion of molecular recognition involving larger scale systems is timely This book was planned with such a development in mind The book begins with an elementary but rigorous account of the various types of forces between molecules Chapter 2 is concerned with the hydrogen bond between pairs of simple molecules in the gas phase with particular reference to the preferred relative orientation of the pair and the ease with which this can be distorted This microscopic view continues in chapter 3 wherein the nature of interactions between solute molecules and solvents or between two or more solutes is examined from the experimental standpoint with various types of spectroscopy providing the probe of the nature of the interactions Molecular recognition is central to the catalysis of chemical reactions especially when bonds are to be broken and formed under the severe constraint that a specific configuration is to result as in the production of enantiotopically pure compounds This important topic is considered in chapter 4

Supramolecular Chemistry Doris Grants, Supramolecular chemistry is a fascinating branch of chemistry that focuses on the study of non covalent interactions between molecules Unlike traditional chemistry which revolves around the formation of covalent bonds between atoms supramolecular chemistry investigates how molecules interact with each other through weaker forces such as hydrogen bonds van der Waals forces ionic interactions and stacking This field offers a deeper understanding of how molecules can form complex assemblies and structures without the need for direct chemical bonding The concept of supramolecular chemistry was first introduced by Jean Marie Lehn Donald J Cram and Charles J Pedersen who were awarded the Nobel Prize in Chemistry in 1987 for their pioneering work They developed the concept of molecular recognition where specific molecules can recognize and bind to each other much like a lock and key This phenomenon has opened up a wide array of possibilities for creating new materials sensors and even systems that mimic biological processes Supramolecular chemistry is not only about the study of individual interactions between molecules but also about understanding how these interactions can lead to the self assembly of complex structures These structures can range from simple aggregates to large intricate molecular machines and materials The ability of molecules to self organize into functional systems is one of the most remarkable aspects of supramolecular chemistry and it has led to numerous applications in fields such as nanotechnology drug delivery and materials science
