Respiratory Support Strategies in the Prevention and Treatment of Bronchopulmonary Dysplasia Huayan Zhang, Robin McKinney, 2023-07-26 Infant chronic lung disease CLD or bronchopulmonary dysplasia BPD one of the most common complications of prematurity carries consequences of high mortality and morbidity Lengthy hospitalizations frequent readmissions chronic cardiopulmonary impairment poor growth and long term neurodevelopmental impairment are common in these patients As a result it is a disease with high social economic impact both to the health care system and society Over the past few decades advances in neonatal intensive care have led to improved survival of extremely premature infants world wide especially in low and middle income countries LMICs This increased survival has also led to a larger number of infants with extremely immature lungs that are prone to abnormal lung development and lung injury Consequently the incidence of BPD has not decreased Although respiratory support is a mainstay therapy for premature infants with acute or chronic respiratory insufficiency there is currently a lack of strong evidence based respiratory support strategies both in the prevention of BPD and treatment of infants with established BPD Over the years there has been a series of advancements in the respiratory management of premature infants including but not limited to less invasive methods of pulmonary surfactant delivery multiple modalities of non invasive respiratory support neonatal specific ventilators with better synchronization and monitoring capabilities use of permissive hypercapnia to minimize the level of ventilation support and international

agreement on the oxygen saturation target However there have been controversies in the safety and efficacy of some of these treatments and much more needs to be learned in how to best apply some of these therapies especially in infants with evolving BPD and established BPD as well as in resource limited settings This Research Topic will focus on respiratory support strategies in the prevention and treatment of BPD We welcome both experimental and clinical research articles exploring the impacts of respiratory support on pulmonary mechanics lung injury lung growth and overall health in premature infants both during their early postnatal days and after they are diagnosed with BPD This article collection will explore but is not limited to the following thematic areas 1 Delivery room respiratory management in the prevention of BPD 2 Use of non invasive respiratory support in premature infants with respiratory distress syndrome RDS evolving BPD or established BPD 3 Mechanical ventilation strategies in intubated premature infants with RDS evolving BPD or established BPD 4 Neurally Adjusted Ventilatory Assist NAVA use in the prevention or treatment of BPD 5 Cardio pulmonary interaction during respiratory support in preterm infants 6 Effects of different respiratory support modalities on pulmonary mechanics lung injury and BPD associated pulmonary hypertension 7 Impact of respiratory support on the growth and development of premature infants 8 Nursing care of premature infants on invasive or non invasive respiratory support 9 Tracheostomy and long term ventilation for infants with BPD 10 Post discharge respiratory support management and respiratory follow up for infants with BPD 11 Impact of infection bacterial or viral including but not limited to gram negative organisms RSV influenza COVID 19 and others on respiratory function in infants with BPD 12 Adjunctive therapies in addition to respiratory support in BPD prevention or in the treatment of BPD 13 Utility of bedside imaging e g lung ultrasound bronchoscopy electric impedance tomography etc in the selection and adjustment of respiratory support 14 Respiratory support related quality improvement in the prevention or management of BPD 15 Family and staff education to care for premature infants with respiratory support

Pediatric and Neonatal Mechanical Ventilation Peter C. Rimensberger, 2014-11-12 Written by outstanding authorities from all over the world this comprehensive new textbook on pediatric and neonatal ventilation puts the focus on the effective delivery of respiratory support to children infants and newborns In the early chapters developmental issues concerning the respiratory system are considered physiological and mechanical principles are introduced and airway management and conventional and alternative ventilation techniques are discussed Thereafter the rational use of mechanical ventilation in various pediatric and neonatal pathologies is explained with the emphasis on a practical step by step approach Respiratory monitoring and safety issues in ventilated patients are considered in detail and many other topics of interest to the bedside clinician are covered including the ethics of withdrawal of respiratory support and educational issues Throughout the text is complemented by numerous illustrations and key information is clearly summarized in tables and lists

Non-Invasive Ventilation, An Issue of Clinics in Perinatology Bradley Yoder, Haresh Kirpalani, 2016-11-15 Preterm birth interrupts the normal developmental progression of most organs particularly when birth occurs at the lowest level of viability An immediate task is to successfully transition to a post natal life without a placental circulation To do this demands careful management of the cardiorespiratory systems To best help the fragile preterm infant at this demanding time care givers must remember two most pressing goals These are first to maintain adequacy of gas exchange and delivery while simultaneously minimizing any secondary injury to the fragile preterm lung However after these immediate priorities in the delivery room the longer term effects of an immature lung development and its associated problems come to the forefront These problems include the inflammation of perinatal infection oxygen and invasive mechanical ventilation Both the immaturity itself and secondary lung injury and its inflammation collectively will often lead to the condition termed bronchopulmonary dysplasia BPD Although many of these infants may eventually be discharged to home without a need for oxygen supplementation or pulmonary medications the long term impact of interrupted lung development and secondary lung injury remain serious concerns It is now well recognized that mechanical ventilation is pivotal to developing secondary lung injury and BPD Consequently a great deal of time and effort has been put into the development and application of non invasive ventilator NIV approaches to supporting respiratory function in neonates Since the landmark publication by Gregory and colleagues in 1967 nasal continuous positive airway pressure nCPAP has been the most commonly applied approach to NIV This approach has been supported by the recent generation of randomized controlled trials However cumulatively these trials have shown only a small reduction in rates of BPD Outside of the trial data

despite the wider application of nCPAP rates of BPD remain relatively unchanged over recent years This has led to investigations of other NIV approaches including nasal ventilation and high flow nasal cannula therapy Not only have available modes increased but so have the interfaces through which these modes may be applied In the issue of Clinic in Perinatology readers will find an up to date review of non invasive approaches to supporting preterm respiratory function This draws on the expertise of leading investigators in the field This issue reviews the physiologic mechanisms by which the various approaches to NIV may support respiratory function the evidence base supporting different NIV approaches and adjunctive aspects of NIV therapy including their use during neonatal transport and the application of other supportive therapies such as inhaled NO
