*Biochemistry of the Eye* Elaine R. Berman, 2013-11-22 My first introduction to the eye came more than three decades ago when my close friend and mentor the late Professor Isaac C Michaelson convinced me that studying the biochemistry of ocular tissues would be a rewarding pursuit I hastened to explain that I knew nothing about the subject since relatively few basic biochemical studies on ocular tissues had appeared in the world literature Professor Michaelson assured me however that two books on eye biochemistry had already been written One of them a beautiful monograph by Arlington Krause 1934 of Johns Hopkins Hospital is well worth reading even today for its historical perspective The other published 22 years later was written by Antoinette Pirie and Ruth van Heyningen 1956 whose pioneering achievements in eye biochemistry at the Nuffield Laboratory of Ophthalmology in Oxford England are known throughout the eye research community and beyond To their credit are classical investigations on retinal corneal and lens biochemistry beginning in the 1940s and continuing for many decades thereafter Their important book written in 1956 on the *Biochemistry of the Eye* is a volume that stood out as a landmark in this field for many years In recent years however a spectacular amount of new information has been generated in ocular biochemistry Moreover there is increasing specialization among investigators in either a specific field of biochemistry or a particular ocular tissue

Molecular Genetics of Inherited Eye Disorders Alan F. Wright, 1994-12-01 *Molecular Genetics of Inherited Eye Disorders* provides an authoritative and up to date account of molecular genetic advances in a wide spectrum of genetic eye disorders and forms the second volume in the *Modern Genetics* book series The field has produced some dramatic and often unexpected findings in recent years ranging from the elegant unravelling of the molecular basis of colour vision defects to the subtle complexity of the retinoblastoma gene The role of crystallins in

congenital cataract and of the rhodopsin molecule in retinitis pigmentosa are discussed illustrating the importance of the candidate gene approach to genetic eye disease Reverse genetic approaches to the cloning of genes responsible for aniridia and choroideremia exemplify the power of the new genetic techniques and signal the start of the next experimental phase in which the functional characterization of identified genes begins
