Real Objects And Models 012:

Object Categorization Sven J. Dickinson, 2009-09-07 This edited volume presents a unique multidisciplinary perspective on the problem of visual object categorization. The result of a series of four highly successful workshops on the topic, the book gathers many of the most distinguished researchers from both computer and human vision to reflect on their experience, identify open problems, and foster a cross-disciplinary discussion with the idea that parallel problems and solutions have arisen in both domains. Twenty-seven of these workshop speakers have contributed chapters, including fourteen from computer vision and thirteen from human vision. Their contributions range from broad perspectives on the problem to more specific approaches, collectively providing important historical context, identifying the major challenges, and presenting recent research results. This multidisciplinary collection is the first of its kind on the topic of object categorization, providing an outstanding context for graduate students and researchers in both computer and human vision. *The Standard Model And Beyond* Ioannis John Demetrius Vergados, 2017-08-11 This book contains a systematic and pedagogical exposition of recent developments in particle physics and cosmology. It starts with two introductory chapters on group theory and the Dirac theory. Then it proceeds with the formulation of the Standard Model (SM) of Particle Physics, particle content, and symmetries, fully exploiting the material of the first two chapters. It discusses the concept of gauge symmetries and emphasizes their role in particle physics. It then analyses the Higgs mechanism and the spontaneous symmetry breaking (SSB). It explains how the particles (gauge bosons and fermions) after the SSB acquire a mass and get admixed. The various forms of the charged currents are discussed in detail, as well as how the parameters of the SM, which cannot be determined by the theory, are fixed by experiment, including the recent LHC data and the Higgs discovery. Quantum chromodynamics is discussed, and various low-energy approximations to it are presented. The Feynman diagrams are introduced and applied at the level of first-year graduate students. Examples are the evaluation of the decay widths of the gauge bosons and some cross sections for interesting processes such as Rutherford scattering, electron-proton scattering, elementary proton or described by a form factor, and inelastic scattering and Compton scattering. After that, the classic topics like the role of C, P, CP symmetries and the experimental methods needed to verify their conservation or violation are discussed in some detail. Topics beyond the standard model, like supersymmetry for pedestrians and grand unification, are discussed. To this end, neutrino oscillations, dark matter, and baryon asymmetry are also briefly discussed at the first-year graduate level. Finally, the book contains an exhibition of recent developments in cosmology, especially from the elementary particle point of view. **Human and Technological Progress Towards the Socio-Economic Paradigm of the Future** Elena G. Popkova, Marina Alpidovskaya, 2020-08-24 This book develops a socio-economic paradigm of the future in the context of digital transformation. The challenge of economic openness is considered through the globalization of the world economic system by the example of modern Russia. The tendency of archaization of socio-economic relations is explored, which is connected with the gradual

disappearance of ineffective institutes and their replacement by new institutes Attention is paid to the regional aspect of the digital economy perspectives of development of the ethno economy in the context of integration of regional economic systems are determined The problem of preserving social identity and supporting the uniqueness of competitive advantages of the region s economy in the conditions of digitization is actualized and its perspective solutions based on a region s globalization management are offered Also the problem of national and regional food security is considered Increased social significance of the agro industrial complex and the necessity for its de economization on the platform of the digital economy are substantiated A new concept of the market economy in the conditions of digitization and the Fourth industrial revolution is developed economic power of technological progress and possibilities of managing and re directing this power are determined The authors substantiate the transition to the Sixth technological mode and the related transformation processes in the economy Also the authors dwell on the problem of the shadow economy and corruption and consider the perspectives of its overcoming based on the possibilities of digital technologies The idea of de regulation based on the possibilities of automatization and AI is opposed to the idea of increase of state regulation based on ubiquitous computing and digital monitoring of economic activities The perspectives of increasing the economy s transparency in the digital age are proved The alternatives to the current model of development of the digital economy are given and scenario analysis of consequences of observing these models based on the cognitive approach is performed New opportunities for development of the integration processes in entrepreneurship in the conditions of the digital economy are shown in particular in the aspect of inter regional and transnational sectorial clustering Clusters are considered as growth points of the Russian economy and the new Russian experience of formation and development of clusters in the sphere of higher education in the context of region s economy is studied The authors determine the contribution of key technological events in the development of entrepreneurship through the example of modern Russia They come to the conclusion that despite the unique possibilities digital technologies do not necessarily create additional value for entrepreneurship and their application could be ineffective due to additional capital expenditures in case of complexity of return of long term venture investments The needs of entrepreneurship for innovative infrastructural provision in the context of the digital economy are determined and barriers on the path of its creation and practical application due to necessity for applying new forms of business organization are shown Specific features of state management of a region s economy in the conditions of digital modernization are shown and the modern Russian practice of e government as a response to the modern challenges is studied The authors outline new perspectives of development of public private partnership as an effective direction of industrial and cluster policy of a modern region

Readings in Computer Vision Martin A. Fischler, Oscar Firschein, 1987-06 The field of computer vision combines techniques from physics mathematics psychology artificial intelligence and computer science to examine how machines might construct meaningful descriptions of their surrounding environment The editors of this volume prominent

researchers and leaders of the SRI International AI Center Perception Group have selected sixty papers most published since 1980 with the viewpoint that computer vision is concerned with solving seven basic problems Reconstructing 3D scenes from 2D images Decomposing images into their component parts Recognizing and assigning labels to scene objects Deducing and describing relations among scene objects Determining the nature of computer architectures that can support the visual function Representing abstractions in the world of computer memory Matching stored descriptions to image representation Each chapter of this volume addresses one of these problems through an introductory discussion which identifies major ideas and summarizes approaches and through reprints of key research papers Two appendices on crucial assumptions in image interpretation and on parallel architectures for vision applications a glossary of technical terms and a comprehensive bibliography and index complete the volume **Readings in Artificial Intelligence and Databases** John

Mylopoulos, Michael L. Brodie, 2014-06-28 The interaction of database and AI technologies is crucial to such applications as data mining active databases and knowledge based expert systems This volume collects the primary readings on the interactions actual and potential between these two fields The editors have chosen articles to balance significant early research and the best and most comprehensive articles from the 1980s An in depth introduction discusses basic research motivations giving a survey of the history concepts and terminology of the interaction Major themes approaches and results open issues and future directions are all discussed including the results of a major survey conducted by the editors of current work in industry and research labs Thirteen sections follow each with a short introduction Topics examined include semantic data models with emphasis on conceptual modeling techniques for databases and information systems and the integration of data model concepts in high level data languages definition and maintenance of integrity constraints in databases and knowledge bases natural language front ends object oriented database management systems implementation issues such as concurrency control and error recovery and representation of time and knowledge incompleteness from the viewpoints of databases logic programming and AI *Resources in education* ,1991 **Author, Subject, and Object Indexes**
