Recent Developments In High Temperature Superconductivity:

Recent Developments in Superconductivity Research Barry P. Martins, 2007 Superconductivity is the ability of certain materials to conduct electrical current with no resistance and extremely low losses High temperature superconductors such as $\text{La}_{2-x}\text{Sr}_x\text{CuO}_x$ T_c 40K and $\text{YBa}_2\text{Cu}_3\text{O}_{7-x}$ T_c 90K were discovered in 1987 and have been actively studied since In spite of an intense world wide research effort during this time a complete understanding of the copper oxide cuprate materials is still lacking Many fundamental questions are unanswered particularly the mechanism by which high T_c superconductivity occurs More broadly the cuprates are in a class of solids with strong electron electron interactions An understanding of such strongly correlated solids is perhaps the major unsolved problem of condensed matter physics with over ten thousand researchers working on this topic High T_c superconductors also have significant potential for applications in technologies ranging from electric power generation and transmission to digital electronics This ability to carry large amounts of current can be applied to electric power devices such as motors and generators and to electricity transmission in power lines For example superconductors can carry as much as 100 times the amount of electricity of ordinary copper or aluminium wires of the same size Many universities research institutes and companies are working to develop high T_c superconductivity applications and considerable progress has been made This volume brings together new leading edge research in the field

The New Superconducting Electronics H. Weinstock, Richard W. Ralston, 2012-12-06 This volume is based on the proceedings of the NATO sponsored Advanced Studies Institute ASn on The New Superconducting Electronics held 9-20 August 1992 in Waterville Valley New Hampshire USA The contents herein are intended to provide an update to an earlier volume on the same subject based on a NATO ASI held in 1988 Four years seems a relatively short time interval and our title itself featuring The New Superconducting Electronics may appear somewhat pretentious Nevertheless we feel strongly that the ASI fostered a timely reexamination of the technical progress and application potential of this rapid paced field There are indeed many new avenues for technological innovation which were not envisioned or considered possible four years ago The greatest advances by far have occurred with regard to oxide superconductors the so called high

transition temperature superconductors known in short as HTS These advances are mainly in the ability to fabricate both 1 high quality relatively large area films for microwave filters and 2 multilayer device structures principally superconducting normal superconducting SNS Josephson junctions for superconducting quantum interference device SQUID magnetometers Additionally we have seen the invention and development of the flux flow transistor a planar three terminal device During the earlier ASI only the very first HTS films with adequate critical current density had just been fabricated and these were of limited area and had high resistance for microwave current
