ABSTRACT Traditional closed-world object detection methods are limited to a predefined set of classes and struggle to recognize objects beyond these boundaries. This work proposes an improved Open-World Object Detection (OWOD) methodology that supports the identification and Incremental Detection of both known and unknown objects. Existing OWOD methods typically face uncertainties due to the adoption of complex and ambiguous strategies for discovering the unknown objects. Such approaches lower the detection accuracy of the known classes. To effectively tackle these challenges, this study presents a new Open-World Novelty and Outlier Detection (OWNOD). The framework integrates a dynamic thresholding mechanism a customized loss function and statistical verification technique optimize the simultaneous detection of both known and unknown objects. By combining these approaches, OWNOD enhances the balance between identifying new, unseen objects and maintaining accuracy for previously learned classes, effectively addressing the inherent complexities of open-world object detection. We benchmark against state-of-the-art methods, that includes the baseline ORE and ABLTL. We also report significant improvements across multiple metrics. For instance, in Task 1, K-mAP improved by 3.10 points, U-mAP by 2.20 points, and U-Recall by 9.50 points. In Task 2, K-mAP improved by 5.65 points, U-mAP by 2.43 points, and U-Recall by 2.46 points. In Task 3, we achieved gains of 4.14 points for K-mAP, 0.34 points for U-mAP, and 6.62 points for U-Recall. For Task 4, where all classes are known, we report a K-mAP improvement of 5.89 points, demonstrating the robustness and effectiveness of our model.

I. INTRODUCTION

Deep learning models have played a significant role in the development of advanced object detection models [1], [2], [3] substantially increasing the potential applications of these models in fields such as autonomous driving, crowd control, visual reasoning, and visual question answering. However, traditional deep learning-based object detection approaches work under a static and closed-world approach, meaning only a predetermined labelled set of classes are detected and evaluated. On the contrary, it is highly likely that in real-world scenarios, the model may encounter instances of unknown classes that are simply ignored or misclassified as any set of learned known classes. Humans have the natural tendency

to distinguish the known classes from the unknown and incrementally update their knowledge base as new labels are available for the unknown classes later. Open-world object detection is aimed at reducing the perceptual gap between humans and machines, hence highlighting the critical need for ongoing research in this area.

Open-World Object Detection (OWOD) aims to extend traditional object detection by enabling the identification of both known and unknown objects in dynamic environments. However, existing OWOD approaches often struggle to maintain a balance in detection accuracy between known and unknown classes. This challenge arises largely due to their reliance on complex strategies for discovering unknown

The Metaphysics of Identity over Time D. Oderberg,1993-10-21 This book is a systematic investigation into the metaphysical foundations of identity over time The author elaborates and evaluates the most common theory about the persistence of objects through time and change namely the classical theory of spatio temporal continuity He shows how the theory requires an ontology of temporal parts according to which objects are made up of temporally extended segments or stages This ontology is criticized as unwarranted by modern space time physics and as internally incoherent The author argues that identity over time should be seen as a primitive or unanalysable phenomenon and that the so called puzzle cases and paradoxes of identity can be dealt with without recourse to such an ontology
