**Sampling, Aliasing, and Data Fidelity for Electronic Imaging Systems, Communications, and Data Acquisition** Gerald C. Holst, 1998      **Vision Models and Applications to Image and Video Processing** Christian J. van den Branden Lambrecht, 2013-03-14 I came to vision science trying to solve an engineering problem I was trying to come up with test and measurement methodologies for digital video systems One of the metrics I wanted to use was some measurement of image quality After some experiments and after an overview of the literature I had to realize that simple computational metrics such as the mean square error are not very effective for this purpose This led me to study notions of vision science and vision modeling As an engineer I found it fascinating Vision science uses computational tools and modeling techniques that are very similar to what we use in signal processing yet it brings you to a new domain that lies at the intersection of engineering biology and cognitive psychology Over the years vision science has made tremendous contributions to engineering and to the field of image processing in particular Such contributions include half toning matrices for the printing industry color correction for digital cameras quantization matrices for image coding As imaging devices are becoming commodities the impact of vision science is becoming even more significant This book is meant to appeal to an engineering audience It is an introduction to vision science and to the design and application of vision models in engineering To achieve this goal we have chosen to organize the book around the main components of vision models      *Remote Sensing Image Fusion* Luciano Alparone, Bruno Aiazzi, Stefano Baronti, Andrea Garzelli, 2015-03-06 A synthesis of more than ten years of experience Remote Sensing Image Fusion covers methods specifically designed for remote sensing imagery The authors supply a comprehensive classification system and rigorous mathematical description of advanced and state of the art methods for pansharpening of multispectral images fusion of hyperspectral and      *Visual Information Processing*, 2000      *Optical Engineering*, 2004 Publishes papers reporting on research and development in optical science and engineering and the practical applications of known optical science engineering and technology      **High-speed Imaging and Sequence Analysis II** A. Duane Montgomery, University of Regina. Department of Mathematics & Statistics, 1977      *Light Field Sampling* Cha Zhang, Tsuhan Chen, 2006-12-01 Light field is one of the most representative image based rendering techniques that generate novel virtual views from images instead of 3D models The

light field capture and rendering process can be considered as a procedure of sampling the light rays in the space and interpolating those in novel views. As a result, light field can be studied as a high dimensional signal sampling problem which has attracted a lot of research interest and become a convergence point between computer graphics and signal processing and even computer vision. This lecture focuses on answering two questions regarding light field sampling: namely, how many images are needed for a light field and if such number is limited, where we should capture them. The book can be divided into three parts. First, we give a complete analysis on uniform sampling of IBR data. By introducing the surface plenoptic function, we are able to analyze the Fourier spectrum of non-Lambertian and occluded scenes. Given the spectrum, we also apply the generalized sampling theorem on the IBR data, which results in better rendering quality than rectangular sampling for complex scenes. Such uniform sampling analysis provides general guidelines on how the images in IBR should be taken. For instance, it shows that non-Lambertian and occluded scenes often require a higher sampling rate. Next, we describe a very general sampling framework named freeform sampling. Freeform sampling handles three kinds of problems: sample reduction, minimum sampling rate to meet an error requirement, and minimization of reconstruction error given a fixed number of samples. When the to-be-reconstructed function values are unknown, freeform sampling becomes active sampling. Algorithms of active sampling are developed for light field and show better results than the traditional uniform sampling approach. Third, we present a self-reconfigurable camera array that we developed, which features a very efficient algorithm for real-time rendering and the ability of automatically reconfiguring the cameras to improve the rendering quality. Both are based on active sampling. Our camera array is able to render dynamic scenes interactively at high quality. To the best of our knowledge, it is the first camera array that can reconfigure the camera positions automatically.
