Sectional Human Anatomy Correlated With Ct And Mri:

Sectional Human Anatomy Man-Chung Han, Chu-Wan Kim (Radiologist), 1989-07-01 *Chest Atlas* Mary L. Durizch, Jesse T. Littleton, 2012-12-06 *Chest Atlas Correlated Thin Section Anatomy in Five Planes* is a highly accurate definitive anatomic reference of the chest. Anatomic specimens and specimen radiographs were obtained from fresh frozen cadavers whose lungs were re-inflated to render the most accurate life-like representation possible. The authors then meticulously matched computed tomography trispiral tomogram and magnetic resonance images of normal subjects to the corresponding anatomic section. A plain film radiograph of each section completes the correlation between cadaver and clinical imaging techniques. Each section from each plane is displayed on a two-page spread containing the labeled anatomic specimen in full color, the anatomic key, and the radiographic images, thus facilitating the correlation of the anatomic specimen and radiographs. The reader's understanding is also enhanced by fresh frozen cadavers meticulously prepared and sectioned. Sectioning of all planes: axial, coronal, sagittal, left oblique, and right oblique. Retention of normal tissue color. Section keys to keep the reader oriented. Uniform labeling key throughout the book. State-of-the-art clinical images precisely correlated to the cadaver sections. This atlas will be especially useful to radiologists, surgeons, and chest physicians who seek a definitive reference source on normal chest anatomy. This book will be an invaluable reference source for correlating diagnostic images with clinical findings.

Atlas of the Human Body Branislav Vidic, Milan Milisavljevic, 2017-03-10 *Atlas of Human Body Central Nervous System and Vascularization* is a multidisciplinary approach to the technical coverage of anatomical structures and relationships. It contains surface and 3D dissection images, native and colored cross-sectional views made in different planes, MRI comparisons, demonstrations of cranial nerve origins, distribution of blood vessels by dissection, and systematic presentation of arterial distribution from the precapillary level using the methyl methacrylate injection and subsequent tissue digestion method. Included throughout are late prenatal, fetal, and early postnatal images to contribute to a better understanding of structure-relationship specificity of differentiation at various developmental intervals, conduits, organs, somatic or branchial derivatives. Each chapter features clinical correlations, providing a unique perspective of side-by-side comparisons of dissection images, magnetic resonance imaging, and computed tomography. Created after many years of professional and scientific cooperation between the authors and their parent institutions, this important resource will serve researchers, students, and doctors in their professional work. Contains over 700 color photos of ideal anatomical preparations and sections of each part of the body that have been prepared, recorded, and processed by the authors. Covers existing gaps including developmental and prenatal periods, detailed vascular anatomy, and neuroanatomy. Features a comprehensive alphabetical index of structures for ease of use. Features a companion website which contains access to all images within the book.
