Sedimentary Processes Quantification Using Radionuclides:

Sedimentary Processes: Quantification Using Radionuclides J. Carroll, I. Lerche, 2003-09-19 The advent of radionuclide methods in geochronology has revolutionized our understanding of modern sedimentary processes in aquatic systems This book examines the principles of the method and its use as a quantitative tool in marine geology with emphasis on the Pb 210 method The assumptions and consequences of models and their behaviour are described providing the necessary background to assess the advantages and trade offs involved when choosing a particular model for application One of the purposes of this volume is to disentangle the influences of complicating factors such as sediment flux variations post depositional diffusion of radionuclides and bio irrigation of sediments to arrive at sediment ages and to properly assess the attendant data uncertainty Environmental impacts of chemical nuclear or other waste material are of concern in a variety of areas around the world today A number of relevant examples are included demonstrating how dating models are useful for determining sources of contaminants and interpreting their influence on the environment The book is set at a level so that an able student or professional should have no difficulty in following the procedures and methods developed Each chapter includes case histories showing the strengths and weaknesses of a given procedure with respect to a data example Included with this volume is the computer source code of a new generation of modelling tools based on inverse numerical analysis techniques This first generation of the modelling tool is included along with detailed instructions and examples for its use in an appendix

Radiological Risk Assessment and Environmental Analysis John E. Till, Helen A. Grogan, 2008-07-10 Radiological Risk Assessment and Environmental Analysis comprehensively explains methods used for estimating risk to people exposed to radioactive materials released to the environment by nuclear facilities or in an emergency such as a nuclear terrorist event This is the first book that merges the diverse disciplines necessary for estimating where radioactive materials go in the environment and the risk they present to people It is not only essential to managers and scientists but is also a teaching text The chapters are arranged to guide the reader through the risk assessment process beginning with the source term where the radioactive material comes from and ending with the conversion to risk In addition to presenting mathematical models used in risk assessment data is included so the reader can perform the calculations Each chapter also provides examples and working problems The book will be a critical component of the rebirth of nuclear energy now taking place as well as an essential resource to prepare for and respond to a nuclear emergency

Handbook of Radioactivity Analysis Michael F. L'Annunziata, 2012-08-16 Authoritative reference providing the principles practical techniques and procedures for the accurate measurement of radioactivity **Marine Radioactivity**, 2004-09-17 This book on Marine Radioactivity sets out to cover most of the aspects of marine radioactivity which have been the focus of scientific study in recent decades The authors and their reviews divide into topic areas which have defined the field over its history They cover the suite of natural radioisotopes which have been present in the oceans since their formation and quantitatively dominate the inventory of radioactivity in the oceans Also addressed are the suite of artificial radionuclides introduced to the oceans as a consequence of the use of the atom for development of nuclear energy nuclear weapons and various applications of nuclear science The major source of these continues to derive from the global fallout of

atmospheric tests of nuclear weapons in the 1950s and 1960s but also includes both planned and accidental releases of radioactivity from both civilian and military nuclear technology The other division of the major study direction depends on whether the objective is to use the radionuclides as powerful tools to study oceanic processes to describe and understand the ocean distribution of the various natural or artificial radionuclides or to assess the different radionuclides impact on and pathways to man or marine organisms The oceans cover 70% of the Earth s surface and thus contains a corresponding large share of the Earth s radioactivity Marine Radioactivity covers topics of recent scientific study in this young field It examines both natural radioactivity radioactivity naturally present in oceans since their formation and artificial radioactivity radioactivity introduced by man and use of atomic and nuclear energy with regard to possible effects on the global environment

Freshwater and Estuarine Radioecology G. Desmet, 1997 Hardbound The Chernobyl accident drew attention to the difficulties of understanding the dynamics of radionuclide transport through the environment using older methods developed after the pseudo steady state pollution resulting after the weapons testing fallout More recent approaches which are reported in this book have incorporated both the dynamic aspects highlighted by the pulse Chernobyl input and the importance of improvement in models that can be brought about by constraining parameters on the basis of a knowledge of the fundamental physics chemistry biology and ecology of the ecosystems involved The papers within this volume include hydrodynamic models of suspended solids transport ion exchange interpretation of radionuclide sorption approaches applying a knowledge of membrane transport kinetics to the uptake of radionuclides by biota the effects of different ecological niches on the relative uptake of radionuclides by different species

Handbook for the Assessment of Soil Erosion and Sedimentation Using Environmental Radionuclides F. Zapata, 2007-05-08 This publication deals with soil erosion and sedimentation Soil erosion and associated sediment deposition are natural landscape forming processes that can be greatly accelerated by human intervention through deforestation overgrazing and non sustainable farming practices Soil erosion and sedimentation may not only cause on site degradation of the natural resource base but also off site problems downstream sediment deposition in fields floodplains and water bodies water pollution eutrophication and reservoir siltation etc with serious environmental and economic impairment There is an urgent need for accurate information to quantify the problem and to underpin the selection of effective soil conservation technologies and sedimentation remediation strategies including assessment of environmental and economic impacts Existing classical techniques to document soil erosion are capable of meeting some of these needs but they all possess important limitations The quest for alternative techniques for assessing soil erosion to complement existing methods directed attention to the use of environmental radionuclides in particular fallout as tracers to quantify rates and establish patterns of soil redistribution within the landscape The concept of a project on the use of environmental radionuclides to quantify soil redistribution was first formulated at an Advisory Group Meeting convened in Vienna April 1993 by the International Atomic Energy Agency IAEA

Application of Geochemical Tracers to Fluvial Sediment Jerry R. Miller, Gail Mackin, Suzanne M. Orbock Miller, 2014-12-03 This book takes an in depth look at the theory and methods inherent in the tracing of riverine sediments Examined tracers include multi elemental concentration data fallout radionuclides e g ^{210}Pb ^{137}Cs ^7Be radiogenic isotopes particularly those of Pb Sr and Nd and novel non traditional stable isotopes e g Cd Cu Hg and Zn the latter of which owe their application to recent advances in analytical chemistry The intended goal is not to replace more traditional analyses of the riverine sediment system but to show how tracer fingerprinting studies can be used to gain insights into system functions that would not otherwise be possible The text then provides researchers and catchment managers with a summary of the strengths and limitations of the examined techniques in terms of their temporal and spatial resolution data requirements and the uncertainties in the generated results The use of environmental tracers has increased significantly during the past decade because it has become clear that documentation of sediment and sediment associated contaminant provenance and dispersal is essential to mitigate their potentially harmful effects on aquatic ecosystems Moreover the use of monitoring programs to determine the source of sediments to a water

body has proven to be a costly labor intensive long term process with a spatial resolution that is limited by the number of monitoring sites that can be effectively maintained Alternative approaches including the identification and analysis of eroded upland areas and the use of distributed modeling routines also have proven problematic The application of tracers within riverine environments has evolved such that they focus on sediments from two general sources upland areas and specific localized anthropogenic point sources Of particular importance to the former is the development of geochemical fingerprinting methods that quantify sediment provenance and to a much lesser degree sediment associated contaminants at the catchment scale These methods have largely developed independently of the use of tracers to document the source and dispersal pathways of contaminated particles from point sources of anthropogenic pollution at the reach to river corridor scale Future studies are likely to begin merging the strengths of both approaches while relying on multiple tracer types to address management and regulatory issues particularly within the context of the rapidly developing field of environmental forensics

Tropical Radioecology J.R. Twining, 2012-12-31 *Tropical Radioecology* is a guide to the wide range of scientific practices and principles of this multidisciplinary field It brings together past and present studies in the tropical and sub tropical areas of the planet highlighting the unique aspects of tropical systems Until recently radioecological models for tropical environments have depended upon data derived from temperate environments despite the differences of these regions in terms of biota and abiotic conditions Since radioactivity can be used to trace environmental processes in humans and other biota this book offers examples of studies in which radiotracers have been used to assess biokinetics in tropical biota Features chapters co authored by world experts that explain the origins inputs distribution behaviour and consequences of radioactivity in tropical and subtropical systems Provides comprehensive lists of relevant data and identifies current knowledge gaps to allow for targeted radioecological research in the future Integrates radioecological information into the most recent radiological consequences modelling and best practice probabilistic ecological risk analysis methodology given the need to understand the implications of enhanced socio economic development in the world s tropical regions
