Long Summer How Climate Changed:

The Long Summer Brian M. Fagan, 2004-01-01 The Long Summer illuminates for the first time the centuries long pattern of human adaptation to the demands and challenges of an ever changing climate demands and challenges that are still with us today BOOK JACKET

The Long Summer Brian Fagan, 2004-12-29 Humanity evolved in an Ice Age in which glaciers covered much of the world But starting about 15 000 years ago temperatures began to climb Civilization and all of recorded history occurred in this warm period the era known as the Holocene the long summer of the human species In The Long Summer Brian Fagan brings us the first detailed record of climate change during these 15 000 years of warming and shows how this climate change gave rise to civilization A thousand year chill led people in the Near East to take up the cultivation of plant foods a catastrophic flood drove settlers to inhabit Europe the drying of the Sahara forced its inhabitants to live along the banks of the Nile and increased rainfall in East Africa provoked the bubonic plague The Long Summer illuminates for the first time the centuries long pattern of human adaptation to the demands and challenges of an ever changing climate challenges that are still with us today

The End of the Long Summer Dianne Dumanoski, 2010-07-13 For the past twelve thousand years Earth s stable climate has allowed human civilization to flourish But this long benign summer is an anomaly in the Earth s history and one that is rapidly coming to a close The radical experiment of our modern industrial civilization is now disrupting our planet s very metabolism our future hinges in large part on how Earth responds Climate change is already bearing down hitting harder and faster than expected The greatest danger is not extreme yet discrete weather events such as Hurricane Katrina or the calamitous wildfires that now plague California but profound and systemic disruptions on a global scale Contrary to the pervasive belief that climate change will be a gradual escalator ride into balmy temperatures the Earth s climate system has a history of radical shifts dramatic shocks that could lead to the collapse of social and economic systems The question is no longer simply how can we stop climate change but how can we as a civilization survive it The guiding values of modern culture have become dangerously obsolete in this new era Yet as renowned environmental journalist Dianne Dumanoski shows little has been done to avert the crisis or to prepare human societies for a time of growing instability In a work of astonishing scope Dumanoski deftly weaves history science and culture to show how the fundamental doctrines of modern society have impeded our ability to respond to this crisis and have fostered an economic globalization that is only increasing our vulnerability at this critical time She exposes the fallacy of banking on a last minute technological fix as well as the perilous trap of believing that humans can succeed in the quest to control nature Only by restructuring our global civilization based on the principles that have allowed Earth s life and our ancestors to survive catastrophe diversity redundancy a degree of self sufficiency social solidarity and an aversion to excessive integration can we restore the flexibility needed to weather the trials ahead In this powerful and prescient book Dumanoski moves beyond now ubiquitous environmental buzzwords about green industries and clean energy to provide a new cultural map through this

magisterial *Climate Change and the Health of Nations* he presents a sweeping and authoritative analysis of how human societies have been shaped by climate events **Impact of Global Changes on Mountains** Velma I. Grover, Axel Borsdorf, Jürgen Breuste, Prakash Chandra Tiwari, Flavia Witkowski Frangetto, 2014-12-19 Mountain regions encompass nearly 24 percent of the total land surface of the earth and are home to approximately 12 percent of the world's population. Their ecosystems play a critical role in sustaining human life both in the highlands and the lowlands. During recent years resource use in high mountain areas has changed mainly in response to the *Global Climate Change Demystified* James G. Speight, 2019-12-17 Tackling one of the most controversial subjects of our time one of the world's foremost environmental and petroleum engineers explores the potential causes and ramifications of global climate change. For too many years climate change also referred to as global warming has been assigned predominantly to the emissions of carbon dioxide through the combustion of fossil fuels. It must never be forgotten or ignored however that the Earth has been constantly changing since its formation and has gone through different eras like glaciations among others. These changes need thousands of years to be made visible and are likely still continuing given the increase in the average temperature of the Earth since the pre industrial period provided that the measurements of past climatic temperatures are accurate and beyond reproach. It follows that the warming trend that has occurred over the past 100 years is very likely to have some origins in natural events as well as in human activity. The precise contributions of natural effects and anthropogenic effects on the climate are not known but it is accurate to conclude that many factors continue to influence climate. Whether or not human activities have become a dominant force in the changing climate and are responsible for most of the warming observed is still open to question. When studying the climate system of the Earth an area of common confusion is whether climate scientists agree or disagree as to whether or not climate change is happening or if it is happening whether or not humans are the primary cause. There are a variety of reasons for this but a majority of scientists who study climate and publish in peer reviewed journals agree that human activity is causing the warming of the Earth. The purpose of this book is to weigh all of these various data points and in a scientific and unemotional way arrive at likely conclusions regarding global climate change. Whether human activity is the main driver behind our current changes in climate one thing is certain Climate change is happening and we all need to make informed rather than emotional decisions **Weather, Climate and Climate Change** Greg O'Hare, John Sweeney, Rob Wilby, 2014-05-22 A timely and accessible analysis of one of the most crucial and contentious issues facing the world today the processes and consequences of natural and human induced changes in the structure and function of the climate system. Integrating the latest scientific developments throughout the text centres on climate change control addressing how weather and climate impact on environment and society **Encyclopedia of Crisis Management** K. Bradley Penuel, Matt Statler, Ryan Hagen, 2013-03 From general theories and concepts exploring the meaning and causes of crisis to practical strategies and techniques relevant to crises of specific types crisis management is thoroughly explored

Features the electronic version of this allows students to explore customized response plans for crises of various sorts Appendices also include a Resource Guide to classic books journals and internet resources in the field a Glossary and a vetted list of crisis management related degree programs crisis management conferences etc *Climate Change in the Himalayas* G. B. Pant, P. Pradeep Kumar, Jayashree V. Revadekar, Narendra Singh, 2017-09-15 This book analyzes the issues associated with climate change in the Himalayas The purpose of choosing the Himalayas as a focus is because it is a particularly fragile mountain system highly sensitive to climate change impacts and it contains one of the largest human populations affected by climate change The book provides extensive data and information regarding the climate history of the Himalayas and the current effects of climate change on Himalayan weather systems and on human and animal populations in the region The book begins with an overview of global climate change with discussions of data trends and international initiatives then segues into a history of climate changes and weather trends in the Himalayas Weather systems of the Himalayas both past and current are analyzed and detailed through climate models seasonal observations of weather fronts and overviews of various climate scenarios The book then discusses climate change impacts and signatures specific to the Central Himalayan region where the largest effects of impacts are observed Readers will discover analysis presented on water resources meteorological changes biodiversity agriculture and human health along with perspectives of management and policy This book will appeal to researchers studying climate science climatology environmental scientists and policymakers
