Variability and Individual Differences in Early Social Perception and Social Cognition Jessica Sommerville, Alia Martin, Talee Ziv, 2016-06-10 Over the past three decades mounting evidence has suggested that infants social perceptual and social cognitive abilities are considerably richer than was once thought By the end of the second year of life infants discriminate faces along various social dimensions attend to and understand others goals and intentions use the emotions of others to guide their learning and behavior attribute dispositional characteristics to other agents and make basic social evaluations What has also become clear is that there is a great deal of variability in infants social perception and cognition A critical

outstanding question concerns the nature and meaning of such variability The proposed Research Topic welcomes papers addressing cutting edge questions regarding variability and individual differences in early social perception and social cognition The goal of these papers is to investigate overarching questions in this domain which are necessary to move the field forward Variability in early social perception and social cognition among other domains in infancy and early childhood is often attributed to noise or overlooked in favor of focusing on age related changes Yet recent work suggests that variability in social perceptual and social cognitive tasks reliably inter relates and predicts real world social behaviors For example infants everyday experience with different face categories predicts individual differences in face processing infants production of goal directed actions predicts their simultaneous understanding of these actions and variability in social attention during the second year of life is related to theory of mind during the preschool years These findings suggest that variability in performance on social perception and social cognition tasks is not merely a nuisance variable but rather may provide the key to addressing significant questions regarding the nature of infants social perception and social cognition and the processes that underlie developmental change Acknowledging and closely examining and investigating variability in early social perceptual and social cognitive abilities may represent a powerful approach for understanding development in at least two ways First variability can signal transitional points in the developmental onset of a given ability Thus such variability and the extent to which variability relates to experience and or other abilities can be used to test hypotheses regarding mechanisms that underlie developmental changes Second variability can represent more enduring individual differences between infants In this case critical questions arise regarding the source of individual differences that is what factors shape the emergence of individual differences and whether such early individual differences contribute to the development of more advanced and sophisticated forms of social cognition and behavior The goal of this Research Topic will be to encourage researchers to take variability in early social perception and cognition seriously Papers that give variability center stage and are aimed at addressing the value of variability for identifying developmental mechanisms as well as investigating the existence source and antecedents of early individual differences in social perception and social cognition are welcomed Taken together the contributed papers will provide integral new information to the study of social perception and social cognition over the first three years of life
