

Mathematics of Imaging: Seeing by Solving

We often depend on images to make sense of our surroundings, be it through explorations of complex molecules that underpin scientific advances, examinations of structures inside the human body to help treat illnesses, or glimpses into the outer reaches of our universe. However, most images begin as a collection of data and must be converted to something that can be interpreted by the human eye. Mathematical and statistical techniques make this possible.

By this process, approximately a dozen to thirty times as much information is processed as would be possible by the unaided human mind.

These studies have shown that the use of a single, standard, group-based, or individualized approach is not sufficient to meet the needs of all students.

In order to construct a three-dimensional image of the molecule, researchers used a technique known as X-ray crystallography.
