Computational Methods for Linear Control Systems Petko Hr. Petkov, Nikolai D. Christov, Mihail M. Konstantinov, 1991-01-01 *Linear Control System Analysis and Design with MATLAB* Constantine H. Houppis, Stuart N. Sheldon, 2013-10-30 This book uses numerous in depth explanations diagrams calculations and tables to provide an intensive overview of modern control theory and control system design Mathematics is kept to a minimum and engineering applications are stressed throughout Completely updated and packed with student friendly features the sixth edition presents a range of updated examples using MATLAB as well as an appendix listing MATLAB functions for optimizing control system analysis and design Over 75 percent of the problems presented in the previous edition have been revised or replaced

Computational Aspects of Linear Control Claude Brezinski, 2013-12-01 Many devices we say dynamical systems or simply systems behave like black boxes they receive an input this input is transformed following some laws usually a differential equation and an output is observed The problem is to regulate the input in order to control the output that is for obtaining a desired output Such a mechanism where the input is modified according to the output measured is called feedback The study

and design of such automatic processes is called control theory. As we will see, the term system embraces any device and control theory has a wide variety of applications in the real world. Control theory is an interdisciplinary domain at the junction of differential and difference equations, system theory, and statistics. Moreover, the solution of a control problem involves many topics of numerical analysis and leads to many interesting computational problems: linear algebra, QR, SVD, projections, Schur complement, structured matrices, localization of eigenvalues, computation of the rank, Jordan normal form, Sylvester and other equations, systems of linear equations, regularization, etc. root localization for polynomials, inversion of the Laplace transform, computation of the matrix exponential, approximation theory, orthogonal polynomials, Padé approximation, continued fractions, and linear fractional transformations, optimization, least squares, dynamic programming, etc. So control theory is also a good excuse for presenting various, sometimes unrelated, issues of numerical analysis and the procedures for their solution. This book is not a book on control.

Computational Methods for Approximation of Large-Scale Dynamical Systems Mohammad Monir Uddin, 2019-04-30

These days, computer-based simulation is considered the quintessential approach to exploring new ideas in the different disciplines of science, engineering, and technology. SET. To perform simulations, a physical system needs to be modeled using mathematics; these models are often represented by linear time-invariant (LTI) continuous-time (CT) systems. Oftentimes, these systems are subject to additional algebraic constraints, leading to first- or second-order differential-algebraic equations (DAEs), otherwise known as descriptor systems. Such large-scale systems generally lead to massive memory requirements and enormous computational complexity, thus restricting frequent simulations, which are required by many applications. To resolve these complexities, the higher-dimensional system may be approximated by a substantially lower-dimensional one through model order reduction (MOR) techniques. *Computational Methods for Approximation of Large-Scale Dynamical Systems* discusses computational techniques for the MOR of large-scale sparse LTI CT systems. Although the book puts emphasis on the MOR of descriptor systems, it begins by showing and comparing the various MOR techniques for standard systems. The book also discusses the low-rank alternating direction implicit (LR-ADI) iteration and the issues related to solving the Lyapunov equation of large-scale sparse LTI systems, to compute the low-rank Gramian factors, which are important components for implementing the Gramian-based MOR. Although this book is primarily aimed at postgraduate students and researchers of the various SET disciplines, the basic contents of this book can be supplemental to the advanced bachelor's level students as well. It can also serve as an invaluable reference to researchers working in academics and industries alike.

Features Provides an up-to-date step-by-step guide for its readers. Each chapter develops theories and provides necessary algorithms, worked examples, numerical experiments, and related exercises. With the combination of this book and its supplementary materials, the reader gains a sound understanding of the topic. The MATLAB codes for some selected algorithms are provided in the book. The solutions to the exercise problems, experiment data sets, and a digital copy of the software are provided on the book's website. The numerical experiments use

real world data sets obtained from industries and research institutes

chapters on nonlinear systems an introductory chapter a mathematical background chapter a short final chapter on further reading and appendixes on basic analysis ordinary differential equations manifolds and the Frobenius theorem and comparison functions and their use in differential equations The introduction to linear system theory presents the full framework of basic state space theory providing just enough detail to prepare students for the material on nonlinear systems Focuses on stability and feedback stabilization Bridges the gap between linear and nonlinear systems for advanced undergraduates and beginning graduate students Balances coverage of linear and nonlinear systems Covers cascade systems Includes many examples and exercises

Design of Linear Multivariable Feedback Control Systems Joseph J.

Bongiorno Jr., Kiheon Park, 2020-07-09 This book contains a derivation of the subset of stabilizing controllers for analog and digital linear time invariant multivariable feedback control systems that insure stable system errors and stable controller outputs for persistent deterministic reference inputs that are trackable and for persistent deterministic disturbance inputs that are rejectable For this subset of stabilizing controllers the Wiener Hopf methodology is then employed to obtain the optimal controller for which a quadratic performance measure is minimized This is done for the completely general standard configuration and methods that enable the trading off of optimality for an improved stability margin and or reduced sensitivity to plant model uncertainty are described New and novel results on the optimal design of decoupled non interacting systems are also presented The results are applied in two examples the one and three degree of freedom configurations These demonstrate that the standard configuration is one encompassing all possible feedback configurations Each chapter is completed by a group of worked examples which reveal additional insights and extensions of the theory presented in the chapter Three of the examples illustrate the application of the theory to two physical cases the depth and pitch control of a submarine and the control of a Rosenbrock process In the latter case designs with and without decoupling are compared This book provides researchers and graduate students working in feedback control with a valuable reference for Wiener Hopf theory of multivariable design Basic knowledge of linear systems and matrix theory is required **Springer**
