This book provides comprehensive analysis of a number of groundwater issues ranging from flow to pollution problems. Several scenarios are considered throughout including flow in leaky unconfined and confined geological formations, crossover flow behavior from confined to confined to semi confined to unconfined and groundwater pollution in dual media. Several mathematical concepts are employed to include into the mathematical models complexities of the geological formation including classical differential operators, fractional derivatives and integral operators, fractal mapping, randomness, piecewise differential and integral operators. It suggests several new and modified models to better predict anomalous behaviours of the flow and movement of pollution within complex geological formations. Numerous mathematical techniques are employed to ensure that all suggested models are well suited and different techniques including analytical methods and numerical methods are used to derive exact and numerical solutions of different groundwater models. Features: Includes modified numerical and analytical methods for solving new and modified models for groundwater flow and transport. Presents new flow and transform models for groundwater transport in complex geological formations. Examines fractal and crossover behaviors and their mathematical formulations. *Mathematical Analysis of Groundwater Flow Models* serves as a valuable resource for graduate and PhD students as well as researchers working within the field of groundwater modeling. *MFPG, Engineering Design Mechanical Failures Prevention Group, 1977*

Image Segmentation Pei-Gee Ho, 2011-04-19

It was estimated that 80% of the information received by human is visual. Image processing is evolving fast and continually. During the past 10 years there has been a significant research increase in image segmentation. To study a specific object in an image its boundary can be highlighted by an image segmentation procedure. The objective of the image segmentation is to simplify the representation of pictures into meaningful information by partitioning into image regions. Image segmentation is a technique to locate certain objects or boundaries within an image. There are many algorithms and techniques have been developed to solve image segmentation problems. The research topics in this book such as level set, active contour, AR time series, image modeling, Support Vector Machines, Pixon based image segmentations, region similarity metric based technique, statistical ANN and JSEG algorithm were written in details. This book brings together many different aspects of the current research on several fields associated to digital image segmentation. Four parts allowed gathering the 27 chapters around the following topics: Survey of Image Segmentation Algorithms, Image Segmentation methods, Image Segmentation Applications and Hardware Implementation. The readers will find the contents in this book enjoyable and get many helpful ideas and overviews on their own study. *Advanced Engineering Mathematics* Erwin Kreyszig, 2020-07-21
