Sediment Records Of Biomab Burning And Global Change:

Holocene Climate and Carbon Sequestration Via Black Carbon Burial in Sediments Nidhi Patel, 2011 Fire a global process that depends on climate volcanic activity vegetation and human practices is not constant through time and varies at decadal centennial and millennial time scales Wildfires that result in burning of large areas of land may increase in frequency in the future as a result of impending global warming Studies have shown a correlation between historically warmer climates and occurrences of wildfires The increased occurrence of these fires may add carbon dioxide CO₂ g to the atmosphere However such wildfires may also have led to CO₂ g sequestration by formation of pyrogenic black carbon BC followed by its subsequent burial In this manner climate driven wildfire occurrence and corresponding BC formation and burial is a negative feedback loop in the carbon cycle Carbon sequestration responding to climate fluctuations through fire occurrences may have implications for climate and carbon cycle models as well as future climate predictions It is hypothesized that an increased abundance in BC formation i e carbon sequestration will be correlated with a drier environment a drier climatic interval in the sedimentary record will correlate with a greater frequency of wildfires and pyrogenic BC abundance This hypothesis was tested in two areas coastal North Carolina and Lake Bosumtwi Ghana Geochronological analysis conducted on a sediment core from coastal NC suggests that the core encompasses a time interval of 1081 Common Era CE to 1979 CE The abundance of BC in the core ranged from 4 % to 97 % and was related to established proxies of paleoclimate temperature and drought Furthermore stable isotopes of BC organic carbon OC and concentrations of polycyclic aromatic hydrocarbons PAHs were also used in an attempt to understand the type of biomass burned The type of biomass burned ranges from C4 plants 1081 until 860 CE to C3 plants 860 CE to present Also in the core from coastal NC cycles of BC excursions relate to climate proxies on decadal and centennial scales In a sediment core from Lake Bosumtwi Ghana the BC abundance relative to TOC is elevated 90 % of the TOC is BC throughout the core Stable isotopic signatures of BC and OC were also analyzed in the sediment core from Lake Bosumtwi These analyses suggested that a shift in vegetation change in environments occurred in western Africa a shift from a drier climate to a moist climate occurred at about 6 cm depth in the core There was not enough sediment to constrain geochronology in this core Both study sites are sensitive to the Atlantic Ocean and other ocean atmospheric teleconnections For example changes in the North Atlantic thermohaline circulation and the Intertropical Convergence Zone ITCZ could have a large influence on droughts and fires in coastal NC and western Africa If a relationship between carbon sequestration and paleoclimate can be identified a better understanding of how climate has affected global carbon cycle over geologic time can be established

Deconvolving Climate and Biotic Signals from Taphonomic Overprints in Deep-sea Records of the Paleocene-eocene Thermal Maximum Brittany Nicole Hupp, 2021 The Paleocene Eocene Thermal Maximum PETM an ancient global warming event that occurred 56 Ma was closely associated with a rapid perturbation to the global carbon cycle making the event an exceptionally relevant analog for evaluating the

future consequences of modern climate change Here I examine deep sea planktic foraminifer records of the PETM from the Weddell Sea ODP Site 690 southern Indian Ocean ODP Site 1135 and equatorial Pacific Ocean ODP Site 865 This dissertation seeks to 1 better characterize geochemical and biotic changes at various latitudes in response to PETM conditions through application of novel techniques and 2 use the stratigraphic record of the PETM to assess how taphonomic processes such as sediment mixing and diagenesis have distorted deep sea records of abrupt climate change In chapters 1 and 2 I use stable carbon ^{13}C and oxygen ^{18}O isotope records constructed with graduated series of size segregated planktic foraminifer shells to show how size dependent sediment mixing has distorted the stratigraphic structure of the Site 690 PETM reference section Chapter 3 demonstrates how the stable isotope signatures of individual foraminifer shells can be used to deconvolve the deleterious effects of sediment mixing on microfossil assemblages associated with abrupt biogeochemical perturbations Application of this isotopic filtering method on the Site 865 PETM record reveals a transient but significant decrease in the diversity of tropical planktic foraminifer communities at the onset of the event contrary to previous interpretations Application of the aforementioned isotopic filtering method to high latitude planktic foraminiferal assemblages of the PETM record of Site 1135 in chapter 4 revealed a similar short lived decrease in diversity previously undetectable in the unfiltered assemblages Lastly in chapter 5 I generate parallel ^{13}C records of the carbon isotope excursion CIE marking the PETM in the Site 1135 section using traditional gas source mass spectrometry GSMS requiring analysis of whole foraminifer shells and secondary ion mass spectrometry SIMS where in situ ^{13}C measurements are made on micrometer scale domains within individual foraminifer shells Comparison of these parallel ^{13}C records shows how GSMS analyses fail to capture the full magnitude of the CIE due to incorporated measurement of diagenetic calcite

A High-Resolution Paleoenvironmental and Paleoclimatic History of Extreme Events on the Laminated Sediment Record from Basin Pond, Fayette, Maine, U.S.A.. Daniel R. Miller, 2015 Future impacts from climate change can be better understood by placing modern climate trends into perspective through extension of the short instrumental records of climate variability This is especially true for extreme climatic events such as extreme precipitation and wildfires as the period of instrumental records provides only a few examples and these have likely have been influenced by anthropogenic warming Multi parameter records showing the past range of climate variability can be obtained from lakes Lakes are particularly good recorders of climate variability because sediment from the surrounding environment accumulates in lakes making them sensitive recorders of climate variability and providing high resolution histories of local environmental conditions in the past In some cases such as at Basin Pond sediment is persevered efficiently enough to produce distinguishable annual laminations varves in the sedimentary record The varved record at Basin Pond was used to construct an accurate highly resolved age to depth model over the past 300 years Using a multi proxy analysis including organic biomarker analysis of molecular compounds and sedimentological features preserved in the sediment record a history of environmental and climatic change at Basin Pond was constructed

These analyses were compared with the record of known extreme events from instrumental measurements and historical documents including 129 years of high resolution precipitation and temperature meteorological data 19 tropical systems over the past 145 years and two known wildfire events over the past 200 years Long term trends in precipitation including the increase in precipitation seen throughout the last half of the 20th century and the drought of the 1940 s were captured in the analysis of long chain n alkane distributions and through varve thickness measurements obtained through X Ray Fluorescence analysis Furthermore Polycyclic Aromatic Hydrocarbons PAHs a class of organic compounds that can be used to trace combustion activity were found in abundance in the Basin Pond sedimentary record Peaks in the abundances of two PAHs retene and chrysene and the ratio retene chrysene were found to be highly correlated with the known wildfire events occurring in the historical period giving promise as using these compounds and ratio as a robust proxy for regional wildfire events in the northeastern U S
