**New Computer Architectures** Jacques Tiberghien, 1984      *Computer Architectures* Theodora Vardouli, Olga Touloumi, 2019-11-19 Computer Architectures is a collection of multidisciplinary historical works unearthing sites concepts and concerns that catalyzed the cross contamination of computers and architecture in the mid 20th century Weaving together intellectual social cultural and material histories this book paints the landscape that brought computing into the imagination production and management of the built environment whilst foregrounding the impact of architecture in shaping technological development The book is organized into sections corresponding to the classic von Neumann diagram for computer architecture program control unit storage memory input output and computation arithmetic logic unit each acting as a quasi material category for parsing debates among architects engineers mathematicians and technologists Collectively authors bring forth the striking homologies between a computer program and an architectural program a wall and an interface computer memory and storage architectures structures of mathematics and structures of things The collection initiates new histories of knowledge and technology production that turn an eye toward disciplinary fusions and their institutional and intellectual drives Constructing the common ground between design and computing this collection addresses audiences working at the nexus of design technology and society including historians and practitioners of design and architecture science and technology scholars and media studies scholars      **Essentials of Computer Architecture** Douglas Comer, 2024-05-20 This easy to read textbook provides an introduction to computer architecture focusing on the essential aspects of hardware that programmers need to know Written from a programmer s point of view Essentials of Computer Architecture Third Edition covers the three key aspects of architecture processors physical and virtual memories and input output I O systems This third edition is updated in view of advances in the field Most students only have experience with high level programming languages and almost no experience tinkering with electronics and hardware As such this text is revised to follow a top down approach moving from discussions on how a compiler transforms a source program into binary code and data to explanations of how a computer represents data and code in binary Additional chapters cover parallelism and data pipelining assessing the performance of computer systems and the important topic of power and energy consumption Exclusive to this third edition a new chapter explains multicore processors and how coherence hardware provides a consistent view of the values in memory even though each core has its own cache Suitable for a one semester undergraduate course this clear concise and easy to read textbook offers an ideal introduction to computer architecture for students studying computer programming      **Advanced Computer Architectures** Sajjan G. Shiva, 2018-10-24 Despite the tremendous advances in performance enabled by modern architectures there are always new applications and demands arising that require ever increasing capabilities Keeping up with these demands requires a deep seated understanding of contemporary architectures in concert with a fundamental understanding of basic principles that allows one to anticipate

what will be possible over the system's lifetime Advanced Computer Architectures focuses on the design of high performance supercomputers with balanced coverage of the hardware software structures and application characteristics This book is a timeless distillation of underlying principles punctuated by real world implementations in popular current and past commercially available systems It briefly reviews the basics of uniprocessor architecture before outlining the most popular processing paradigms performance evaluation and cost factor considerations This builds to a discussion of pipeline design and vector processors data parallel architectures and multiprocessor systems Rounding out the book the final chapter explores some important current and emerging trends such as Dataflow Grid biology inspired and optical computing More than 220 figures tables and equations illustrate the concepts presented Based on the author's more than thirty years of teaching and research Advanced Computer Architectures endows you with the tools necessary to reach the limits of existing technology and ultimately to break them

**Computer Architectures for Spatially Distributed Data** Herbert Freeman, G.G. Pieroni, 2013-11-09 These are the proceedings of a NATO Advanced Study Institute ASI held in Cetraro Italy during 6-17 June 1983 The title of the ASI was Computer Architectures for Spatially Distributed Data and it brought together some 60 participants from Europe and America Presented here are 21 of the lectures that were delivered The articles cover a wide spectrum of topics related to computer architecture's specially oriented toward the fast processing of spatial data and represent an excellent review of the state of the art of this topic For more than 20 years now researchers in pattern recognition image processing meteorology remote sensing and computer engineering have been looking toward new forms of computer architectures to speed the processing of data from two and three dimensional processes The work can be said to have commenced with the landmark article by Steve Unger in 1958 and it received a strong forward push with the development of the ILIAC III and IV computers at the University of Illinois during the 1960's One clear obstacle faced by the computer designers in those days was the limitation of the state of the art of hardware when the only switching devices available to them were discrete transistors As a result parallel processing was generally considered to be impractical and relatively little progress was made
