## **Ray Shooting Depth Orders And Hidden Surface Removal Lecture Notes In Computer Science:**

**Ray Shooting, Depth Orders and Hidden Surface Removal** Mark de Berg,1993-08-30 Computational geometry is the part of theoretical computer science that concerns itself with geometrical objects it aims to define efficient algorithms for problems involving points lines polygons and so on The field has gained popularity very rapidly during the last decade This is partly due to the many application areas of computational geometry and partly due to the beauty of the field itself This monograph focuses on three problems that arise in three dimensional computational geometry The first problem is the ray shooting problem preprocess a set of polyhedra into a data structure such that the first polyhedron that is hit by a query ray can be determined quickly The second problem is that of computing depth orders we want to sort a set of polyhedra such that if one polyhedron is partially obscured by another polyhedron then it comes first in the order The third problem is the hidden surface removal problem given a set of polyhedra and a view point compute which parts of the polyhedra are visible from the view point These three problems involve issues that are fundamental to three dimensional computational geometry The book also contains a large introductory part discussing the techniques used to tackle the problems This part should interest not only those who need the background for the rest of the book but also anyone who wants to know more about some recent techniques in computational geometry    [Algorithmic Geometry](#) Jean-Daniel Boissonnat,Mariette Yvinec,1998-03-05 The design and analysis of geometric algorithms have seen remarkable growth in recent years due to their application in for example computer vision graphics medical imaging and CAD The goals of this book are twofold first to provide a coherent and systematic treatment of the foundations secondly to present algorithmic solutions that are amenable to rigorous analysis and are efficient in practical situations When possible the algorithms are presented in their most general d dimensional setting Specific developments are given for the 2 or 3 dimensional cases when this results in significant improvements The presentation is confined to Euclidean affine geometry though the authors indicate whenever the treatment can be extended to curves and surfaces The prerequisites for using the book are few which will make it ideal for teaching advanced undergraduate or beginning graduate courses in computational geometry

**Davenport-Schinzel Sequences and Their Geometric Applications** Micha Sharir, Pankaj K. Agarwal, 1995-05-26

These sequences exhibit some surprising properties that make them a fascinating subject for research in combinatorial analysis. This 1995 book on the subject by two of its leading researchers will be an important resource for students and professionals in combinatorics, computational geometry and related fields. The Newton-Cauchy Framework John L. Nazareth, 1994-02-28 Computational unconstrained nonlinear optimization comes to life from a study of the interplay between the metric based Cauchy and model based Newton points of view. The motivating problem is that of minimizing a convex quadratic function. This research monograph reveals for the first time the essential unity of the subject. It explores the relationships between the main methods, develops the Newton-Cauchy framework and points out its rich wealth of algorithmic implications and basic conceptual methods. The monograph also makes a valuable contribution to unifying the notation and terminology of the subject. It is addressed to practitioners, researchers, instructors and students and provides a useful and refreshing new perspective on computational nonlinear optimization. Algorithm Theory, 1994

**Visualization of Scientific Parallel Programs** Gerald Tomas, Christoph W. Ueberhuber, 1994-02-28 The substantial effort of parallelizing scientific programs is only justified if the resulting codes are efficient. Thus all types of performance tuning are important to parallel software development. But performance improvements are much more difficult to achieve with parallel programs than with sequential programs. One way to overcome this difficulty is to bring in graphical tools. This monograph covers recent developments in parallel program visualization techniques and tools and demonstrates the application of specific visualization techniques and software tools to scientific parallel programs. The solution of initial value problems of ordinary differential equations and numerical integration are treated in detail as two important examples.

*Combinatorial Geometry and Its Algorithmic Applications* János Pach, Micha Sharir, 2009 Based on a lecture series given by the authors at a satellite meeting of the 2006 International Congress of Mathematicians and on many articles written by them and their collaborators, this volume provides a comprehensive up-to-date survey of several core areas of combinatorial geometry. It describes the beginnings of the subject going back to the nineteenth century if not to Euclid and explains why counting incidences and estimating the combinatorial complexity of various arrangements of geometric objects became the theoretical backbone of computational geometry in the 1980s and 1990s. The combinatorial techniques outlined in this book have found applications in many areas of computer science from graph drawing through hidden surface removal and motion planning to frequency allocation in cellular networks. Combinatorial Geometry and Its Algorithmic Applications is intended as a source book for professional mathematicians and computer scientists as well as for graduate students interested in combinatorics and geometry. Most chapters start with an attractive, simply formulated but often difficult and only partially answered mathematical question and describes the most efficient techniques developed for its solution. The text includes

many challenging open problems figures and an extensive bibliography BOOK JACKET      **Advances in Artificial Intelligence** Pietro Torasso, 1993-10-05 This book contains 22 long papers and 13 short ones selected for the Scientific Track of the Third Congress of the Italian Association for Artificial Intelligence The long papers report completed work whereas the short papers are mainly devoted to ongoing research The papers report significant work carried out in the different subfields of artificial intelligence not only in Italy but also elsewhere 8 of the papers come from outside Italy with 2 from the United States and 1 each from Australia Austria Germany The Netherlands Spain and Turkey The papers in the book are grouped into parts on automated reasoning cognitive models connectionist models and subsymbolic approaches knowledge representation and reasoning languages architectures and tools for AI machine learning natural language planning and robotics and reasoning about physical systems and artifacts
