## **Lunar Wake:**

**Low-Frequency Waves in Space Plasmas** Andreas Keiling, Dong-Hun Lee, Valery Nakariakov, 2016-04-04 Low frequency waves in space plasmas have been studied for several decades and our knowledge gain has been incremental with several paradigm changing leaps forward In our solar system such waves occur in the ionospheres and magnetospheres of planets and around our Moon They occur in the solar wind and more recently they have been confirmed in the Sun s atmosphere as well The goal of wave research is to understand their generation their propagation and their interaction with the surrounding plasma Low frequency Waves in Space Plasmas presents a concise and authoritative up to date look on where wave research stands What have we learned in the last decade What are unanswered questions While in the past waves in different astrophysical plasmas have been largely treated in separate books the unique feature of this monograph is that it covers waves in many plasma regions including Waves in geospace including ionosphere and magnetosphere Waves in planetary magnetospheres Waves at the Moon Waves in the solar wind Waves in the solar atmosphere Because of the breadth of topics covered this volume should appeal to a broad community of space scientists and students and it should also be of interest to astronomers astrophysicists who are studying space plasmas beyond our Solar System

**Encyclopedia of Lunar Science** Brian Cudnik, 2023-05-13 The Encyclopedia of Lunar Science includes the latest topical data definitions and explanations of the many and varied facets of lunar science This is a very useful reference work for a broad audience not limited to the professional lunar scientist general astronomers researchers theoreticians practitioners graduate students undergraduate students and astrophysicists as well as geologists and engineers The title includes all current areas of lunar science with the topical entries being established tertiary literature The work is technically suitable to most advanced undergraduate and graduate students The articles include topics of varying technical levels so that the top scientists of the field find this work a benefit as well as the graduate students and the budding lunar scientists A few examples of topical areas are as follows Basaltic Volcanism Lunar Chemistry Time and Motion Coordinates Cosmic Weathering through Meteoritic Impact Environment Geology Geologic History Impacts and Impact Processes Lunar Surface Processes Origin and Evolution Theories Regolith Stratigraphy Tectonic Activity Topography Weathering through ionizing radiation from the solar wind solar flares and cosmic rays

**Magnetotails in the Solar System** Andreas Keiling, Caitríona Jackman, Peter Delamere, 2015-02-02 All magnetized planets in our solar system Mercury Earth Jupiter Saturn Uranus and Neptune interact strongly with the solar wind and possess well developed magnetotails It is not only the strongly magnetized planets that have magnetotails Mars and Venus have no global intrinsic magnetic field yet they possess induced magnetotails Comets have magnetotails that are formed by the draping of the interplanetary magnetic field In the case of planetary satellites moons the magnetotail refers to the wake region behind the satellite in the flow of either the solar wind or the magnetosphere of its parent planet The largest magnetotail of all in our solar system is the heliotail the magnetotail of the heliosphere The variety

of solar wind conditions planetary rotation rates ionospheric conductivity and physical dimensions provide an outstanding opportunity to extend our understanding of the influence of these factors on magnetotail processes and structures Volume highlights include Discussion on why a magnetotail is a fundamental problem of magnetospheric physics Unique collection of tutorials on a large range of magnetotails in our solar system In depth reviews comparing magnetotail processes at Earth with other magnetotail structures found throughout the heliosphere Collectively Magnetotails in the Solar System brings together for the first time in one book a collection of tutorials and current developments addressing different types of magnetotails As a result this book should appeal to a broad community of space scientists and it should also be of interest to astronomers who are looking at tail like structures beyond our solar system *Interactions of Earth's Magnetotail Plasma with the Surface, Plasma, and Magnetic Anomalies of the Moon* Yuki Harada, 2014-08-18 This thesis describes the essential features of Moon plasma interactions with a particular emphasis on the Earth's magnetotail plasma regime from both observational and theoretical standpoints The Moon lacks a dense atmosphere as well as a strong intrinsic magnetic field As a result its interactions with the ambient plasma are drastically different from solar wind interactions with magnetized planets such as Earth The Moon encounters a wide range of plasma regime from the relatively dense cold supersonic solar wind plasma to the low density hot subsonic plasma in the geomagnetic tail In this book the author presents a series of new observations from recent lunar missions i.e Kaguya ARTEMIS and Chandrayaan 1 demonstrating the importance of the electron gyro scale dynamics plasma of lunar origin and hot plasma interactions with lunar magnetic anomalies The similarity and difference between the Moon plasma interactions in the geomagnetic tail and those in the solar wind are discussed throughout the thesis The basic knowledge presented in this book can be applied to plasma interactions with airless bodies throughout the solar system and beyond Nuclear Science Abstracts, 1969 *Publications of Goddard Space Flight Center* Goddard Space Flight Center, **The Hybrid Multiscale Simulation Technology** Alexander S. Lipatov, 2013-04-17 This book addresses hybrid simulation of plasmas it is aimed at developing insight into the essence of plasma behavior Major current applications are to astrophysical and space plasmas Some applications are connected with active experiments in space However hybrid simulations are also being used to gain an understanding of basic plasma phenomena such as particle acceleration by shocks magnetic field reconnect ion in neutral current sheets generation of waves by beams mass loading of the supersonic flow by heavy pickup ions and the dynamics of tangential discontinuities Such simulations may be very important not only for the study of the astrophysical plasmas but also for the study of the magnetically and inertially contained fusion plasmas and other laboratory plasma devices Plasma is the fourth state of matter consisting of electrons ions and 4 neutral atoms usually at temperatures above 10 K The stars and sun are plasmas the local interstellar medium the solar wind magnetospheres and ionospheres of planets and comets Van Allen belts etc are all plasmas Indeed much of the known matter in the universe is plasma **New View of the Moon 2** Clive R. Neal, Lisa R. Gaddis, Bradley L. Jolliff, Samuel

J. Lawrence, Stephen J. Mackwell, Charles K. Shearer, Sarah N. Valencia, 2024-05-06 Much has happened in the world in the 17 years since the first *New Views of the Moon* was published as volume 60 of the Mineralogical Society of America in 2006. An exciting new era of lunar exploration has begun including the promise of resuming human lunar exploration exploring the lunar Poles and missions to many other high priority science targets. It is fitting therefore to now summarize the current state of knowledge to the degree possible at a time when advancements in knowledge of the Moon are proceeding at a breakneck pace. Therefore during this period of unprecedented lunar exploration activity and as we continue to rebound from a global pandemic we now happily announce this *New Views of the Moon 2* volume summarizing the advances in lunar science and exploration since 2006. The Steering Committee is eternally grateful to all contributors and especially the chapter leads and to Professor Makiko Ohtake University of Aizu Japan and Dr David Blewett Johns Hopkins University Applied Physics Laboratory U S A for organizing the *New Views of the Moon 2* Electronic Annex. We deeply appreciate the hard work and dedication of everyone involved in the production of this volume especially Rachel Russell and Ian Swainson at the Mineralogical Society of America. This volume helps to frame our knowledge and expectations for an exciting future of lunar science and exploration and the new discoveries to be made. Having humans return to the Moon now seems more likely than it ever has since the last humans left the Moon on 14 December 1972.

#### **Physics of Collisionless Shocks** André

Balogh, Rudolf A. Treumann, 2013-01-04 The present book provides a contemporary systematic treatment of shock waves in high temperature collisionless plasmas as are encountered in near Earth space and in Astrophysics. It consists of two parts. Part I develops the complete theory of shocks in dilute hot plasmas under the assumption of absence of collisions among the charged particles when the interaction is mediated solely by the self consistent electromagnetic fields. Such shocks are naturally magnetised implying that the magnetic field plays an important role in their evolution and dynamics. This part treats subcritical shocks which dissipate flow energy by generating anomalous resistance or viscosity. The main emphasis is however on super critical shocks where the anomalous dissipation is insufficient to retard the upstream flow. These shocks depending on the direction of the upstream magnetic field are distinguished as quasi perpendicular and quasi parallel shocks which exhibit different behaviours reflecting particles back upstream and generating high electromagnetic wave intensities. Particle acceleration and turbulence at such shocks become possible and important. Part II treats planetary bow shocks and the famous Heliospheric Termination shock as examples of two applications of the theory developed in part I.

#### **The ARTEMIS Mission** Christopher Russell, Vassilis Angelopoulos, 2013-11-18

The ARTEMIS mission was initiated by skillfully moving the two outermost Earth orbiting THEMIS spacecraft into lunar orbit to conduct unprecedented dual spacecraft observations of the lunar environment. ARTEMIS stands for Acceleration Reconnection Turbulence and Electrodynamics of the Moon's Interaction with the Sun. Indeed this volume discusses initial findings related to the Moon's magnetic and plasma environments and the electrical conductivity of the lunar interior. This
