Abstract The purpose of this study was to determine the effects of a 12-week, supervised, resistance training program on the strength and endurance of the lower extremities in healthy young adults. The subjects were 15 male and 15 female college students, aged 18 to 25 years, who were randomly assigned to either the training or control group. The training group performed a resistance training program consisting of three sessions per week for 12 weeks. The control group performed no training. The results of the study showed that the training group had significantly greater increases in strength and endurance than the control group. The training group also had significantly greater increases in body mass and body fat percentage than the control group. The results of this study suggest that a supervised, resistance training program can improve the strength and endurance of the lower extremities in healthy young adults.

Neuroendocrine therapy (NET) treats the body's ability to produce and release hormones, resulting in decreased production of cancer-fostering hormones. Neuroendocrine therapy (NET) may be administered as directed or as a result of a previously diagnosed condition such as diabetes, thyroid disease, or pituitary gland disease. Neuroendocrine therapy can also be used to treat certain types of cancer, such as prostate cancer.

Abstract: *Staphylococcus aureus* (St. *aureus*) is a Gram-positive, spherical bacterium that is commonly found in the human body and in the environment. It is a leading cause of hospital-acquired infections and is also a common cause of community-acquired infections. St. *aureus* is known for its ability to form biofilms, which are communities of bacteria that are attached to a surface and are resistant to antibiotics and the immune system. This paper discusses the characteristics of St. *aureus*, its role in disease, and the challenges of treating infections caused by this bacterium.

Thyroglossal Duct Cyst – congenital malformation of the thyroid gland, often found in the midline of the neck, below the larynx. It is a remnant of the thyroglossal duct, which is the embryonic structure that gives rise to the thyroid gland. The cyst is typically filled with clear, straw-colored fluid and may contain small pieces of thyroid tissue. It can be associated with a palpable lump in the neck, which may enlarge with swallowing or tongue protrusion. Treatment often involves surgical removal of the cyst and a portion of the thyroid gland.
