classification is fundamental to many of the automated electronic systems in use today. However, despite the existence of a number of notable books in the field, the subject remains very challenging, especially for the beginner. *Pattern Recognition and Classification* presents a comprehensive introduction to the core concepts involved in automated pattern recognition. It is designed to be accessible to newcomers from varied backgrounds but it will also be useful to researchers and professionals in image and signal processing and analysis and in computer vision. Fundamental concepts of supervised and unsupervised classification are presented in an informal rather than axiomatic treatment so that the reader can quickly acquire the necessary background for applying the concepts to real problems. More advanced topics such as semi-supervised classification, combining clustering algorithms and relevance feedback are addressed in the later chapters. This book is suitable for undergraduates and graduates studying pattern recognition and machine learning.

Classification and Learning Using Genetic Algorithms Sanghamitra Bandyopadhyay, Sankar Kumar Pal, 2007-05-17 This book provides a unified framework that describes how genetic learning can be used to design pattern recognition and learning systems. It examines how a search technique, the genetic algorithm, can be used for pattern classification, mainly through approximating decision boundaries. Coverage also demonstrates the effectiveness of the genetic classifiers vis-à-vis several widely used classifiers including neural networks.

Standard Handbook of Industrial Automation Douglas M. Considine, Glenn D. Considine, 2012-12-06 The authors and editors of this Handbook have attempted to fill a serious gap in the professional literature on industrial automation. Much past attention has been directed to the general concepts and philosophy of automation as a way to convince owners and managers of manufacturing facilities that automation is indeed one of the few avenues available to increase productivity and improve competitive position. Seventy-three contributors share their knowledge in this Handbook. Less attention has been given to the What and How of automation. To the extent feasible and practical within the confines of the pages allowed, this Handbook concentrates on the implementation of automation. Once the Go signal has been given by management, concrete details, not broad definitions and philosophical discussions, are required. To be found in this distinctly different book in the field are detailed parameters for designing and specifying equipment, the options available with an evaluation of their relative advantages and limitations, and insights for engineers and production managers on the operation and capabilities of present

generation automation system components subsystems and total systems In a number of instances the logical extension of current technology into the future is given A total of 445 diagrams and photos and 57 tables augments detailed discussions In addition to its use as a ready reference for technical and management personnel the book has wide potential for training and group discussions at the college and university level and for special education programs as may be provided by consultants or by in house training personnel

Pattern Classification Richard O. Duda, Peter E. Hart, David G. Stork, 2012-11-09 The first edition published in 1973 has become a classic reference in the field Now with the second edition readers will find information on key new topics such as neural networks and statistical pattern recognition the theory of machine learning and the theory of invariances Also included are worked examples comparisons between different methods extensive graphics expanded exercises and computer project topics An Instructor's Manual presenting detailed solutions to all the problems in the book is available from the Wiley editorial department

AI-Driven Volunteer Selection Jesko Elsner, 2015-03-03 In case of medical emergency situations a Volunteer Notification System aims to alarm potential helpers who can arrive at the victim fast enough to provide cardiopulmonary resuscitation until the professional EMS arrive on scene A simplistic solution for selecting the corresponding volunteers is described by a so called notification radius i.e. alarming any volunteer with a geographic location that is within a maximum distance from the victim Whilst the actual geographical distance is an important parameter to be considered this work will illustrate that various additional decision parameters are of importance and elaborate an AI driven volunteer selection system to increase the reliability and efficiency of occurring notifications
