Resolving Maps And The Dimension Group For Shifts Of Finite Type:

Resolving Maps and the Dimension Group for Shifts of Finite Type Mike Boyle, Brian Marcus, Paul Trow, 1987 We give several results on necessary and sufficient conditions for the existence of special classes of maps from one shift of finite type onto another of the same entropy The classes we study include eventual right closing maps common right closing extensions and stable right closing maps Some analogous results for sofic systems are also given The necessary and sufficient conditions are described algebraically in terms of the dimension group associated to a shift of finite type by W Krieger

Resolving Markov Chains onto Bernoulli Shifts via Positive Polynomials Brian Marcus, Selim Tuncel, 2001 The two parts of this monograph contain two separate but related papers The longer paper in Part A obtains necessary and sufficient conditions for several types of codings of Markov chains onto Bernoulli shifts It proceeds by replacing the defining stochastic matrix of each Markov chain by a matrix whose entries are polynomials with positive coefficients in several variables a Bernoulli shift is represented by a single polynomial with positive coefficients p This transforms jointly topological and measure theoretic coding problems into combinatorial ones In solving the combinatorial problems in Part A the work states and makes use of facts from Part B concerning p DEGREES n and its coefficients Part B contains the shorter paper on p DEGREES n and its coefficients and is independent

Different Aspects of Coding Theory Robert Calderbank, 1995 The symposia in applied mathematics have been held under the auspices of the American Mathematical Society and others since 1967 This book connects coding theory with actual applications in consumer electronics and with other areas of mathematics It covers in detail the mathematical foundations of digital data storage and makes connections to symbolic dynamics linear systems and finite automata It also explores the use of algebraic geometry within coding theory and examines links with finite geometry statistics and theoretical computer science

Geometric and Probabilistic Structures in Dynamics Keith Burns, Dmitry Dolgopyat, Ya. B. Pesin, 2008 This book presents a collection of articles that cover areas of mathematics related to dynamical systems The authors are well known experts who use geometric and probabilistic methods to study interesting problems in the theory of dynamical systems and its applications Some of the articles are surveys while others are original contributions The topics covered include Riemannian geometry models in mathematical physics and mathematical biology symbolic dynamics random and stochastic dynamics This book can be used by graduate students and researchers in dynamical systems and its applications

Encyclopaedia of Mathematics Michiel Hazewinkel, 2012-12-06 This ENCYCLOPAEDIA OF MATHEMATICS aims to be a reference work for all parts of mathematics It is a translation with updates and editorial comments of the Soviet Mathematical Encyclopaedia published by Soviet Encyclopaedia Publishing House in five volumes in 1977 1985 The annotated translation consists of ten volumes including a special index volume There are three kinds of articles in this ENCYCLOPAEDIA First of all there are survey type articles dealing with the various main directions in mathematics where a rather fine subdivision has been used The main requirement for these articles has been

that they should give a reasonably complete up to date account of the current state of affairs in these areas and that they should be maximally accessible On the whole these articles should be understandable to mathematics students in their first specialization years to graduates from other mathematical areas and depending on the specific subject to specialists in other domains of science engineers and teachers of mathematics These articles treat their material at a fairly general level and aim to give an idea of the kind of problems techniques and concepts involved in the area in question They also contain background and motivation rather than precise statements of precise theorems with detailed definitions and technical details on how to carry out proofs and constructions The second kind of article of medium length contains more detailed concrete problems results and techniques

Symbolic Dynamics Bruce P. Kitchens, 2012-12-06 Nearly one hundred years ago Jacques Hadamard used infinite sequences of symbols to analyze the distribution of geodesics on certain surfaces That was the beginning of symbolic dynamics In the 1930 s and 40 s Arnold Hedlund and Marston Morse again used infinite sequences to investigate geodesics on surfaces of negative curvature They coined the term symbolic dynamics and began to study sequence spaces with the shift transformation as dynamical systems In the 1940 s Claude Shannon used sequence spaces to describe information channels Since that time symbolic dynamics has been used in ergodic theory topological dynamics hyperbolic dynamics information theory and complex dynamics Symbolic dynamical systems with a finite memory are studied in this book They are the topological Markov shifts Each can be defined by transition rules and the rules can be summarized by a transition matrix The study naturally divides into two parts The first part is about topological Markov shifts where the alphabet is finite The second part is concerned with topological Markov shifts whose alphabet is countably infinite The techniques used in the two cases are quite different When the alphabet is finite most of the methods are combinatorial or algebraic When the alphabet is infinite the methods are much more analytic This book grew from notes for a graduate course taught at Wesleyan University in the fall of 1994 and is intended as a graduate text and as a reference book for mathematicians working in related fields

Codes, Systems, and Graphical Models Brian Marcus, Joachim Rosenthal, 2012-12-06 Coding theory system theory and symbolic dynamics have much in common Among the central themes in each of these subjects are the construction of state space representations understanding of fundamental structural properties of sequence spaces construction of input output systems and understanding the special role played by algebraic structure A major new theme in this area of research is that of codes and systems based on graphical models This volume contains survey and research articles from leading researchers at the interface of these subjects
