Gabriel Coscas, Felice Cardillo Piccolino, 2012-12-06 This volume of Documenta Ophthalmologica Proceedings Series collects the scientific papers presented at the 2nd International Symposium on Retinal Pigment Epithelium and the 4th Meeting of the European Macula Group held in Genoa May 29 June 1 1996 The Symposium on Retinal Pigment Epithelium was promoted by the University Eye Clinic of Genoa as the natural continuation of the first Symposium held with great success in Genoa in 1988 The previous Meetings of the European Macula Group were held in Coimbra 1988 Crete 1989 and Athens 1994 I was greatly pleased and honoured to host the fourth congress of this distinguished Society and I am grateful to Gabriel Coscas Jose Cunha Vaz and George Theodossiadis founders of the Society for selecting Genoa on this occasion The two meetings integrated well in an unicum and brought together an exceptional number of outstanding retinal specialists coming from all over the world All the aspects of the current research concerning retinal pigment epithelial and macular diseases were covered Several interesting presentations regarded new techniques of retinal and choroidal imaging A full session was dedicated to the latest advances in culture and transplantation of retinal pigment epithelial cells Age related macular degeneration was a major subject for discussion including new approaches to treatment This topic was highlighted by a mini

symposium on drusen including a series of superb lectures on classification clinicopathological studies indocyanine green imaging and laser treatment for prevention of choroidal neovascularization Retinal Pigment Epithelium Transplantation in Retinal Diseases F. K. Chen, 2011 Age related macular degeneration AMD and inherited macular diseases IMD are retinal disorders that can cause blindness through atrophy of the retinal pigment epithelium RPE or choroidal neovascularisation CNV RPE transplantation in severe forms of neovascular AMD has been performed with promising short term outcomes However this approach has not been evaluated in atrophic types of AMD or IMD Furthermore the long term outcomes of photoreceptors cell function rescue by RPE reconstruction in neovascular AMD is unknown Current surgical techniques are complex with associated high complication rates Therefore other treatment approaches to reconstruct the RPE are required This thesis aims to examine whether long term photoreceptor cell function rescue can be achieved through RPE reconstruction by investigating the outcomes of autologous RPE transplantation or full macular translocation in AMD and IMD A further aim is to determine the feasibility of a new approach to reconstruct the RPE using human embryonic stem cell hESC A prospective study of autologous RPE choroid grafts in 9 patients with atrophic macular disease secondary to AMD or IMD demonstrated that submacular RPE graft can support retinal function and fixation However there was a high surgical and post operative complication rates and the overall visual acuity and reading ability declined Long term follow up demonstrated that the graft can maintain retinal function for over 2 years in some patients A retrospective review of long term outcomes following autologous RPE choroid grafts and full macular translocation in 12 and 40 patients with neovascular AMD respectively showed that rescue of retinal function beyond 2 years is possible A visual acuity of 6/12 was achieved and maintained for over 2 years in 8% and 15% of patients who had patch graft and translocation respectively However overall visual acuity outcomes were limited by delayed post operative complications such as recurrent CNV and cystoid macular oedema A prospective porcine experiment showed that subretinal implant of hESC derived RPE was feasible and human donor cell can survive in vivo for up to 6 weeks However there was significant loss of the hESC RPE which may have occurred intra operatively or during the first 2 weeks post operatively Macrophages were noted at the site of the graft suggesting some inflammatory and immunological responses to the human cells polyester substrate or surgical trauma The work in this thesis has provided the proof of principle that reconstruction of the RPE can maintain retinal function in atrophic and neovascular macular diseases over the long term A novel approach using hESC RPE on an artificial substrate may be a more feasible and safer alternative to current clinical techniques of RPE reconstruction Retinal Pigment Epithelial Detachment Maria Andreea Gamulescu, Horst Helbig, Joachim Wachtlin, 2017-08-23 This excellently illustrated book offers detailed guidance on the differential diagnosis and therapy of detachment of the retinal pigment epithelium PED a frequently seen feature in various diseases of the eye Introductory chapters discuss the anatomy pathophysiology and imaging of PEDs highlighting how especially the increasing use of spectral domain OCT enables even small PEDs to be detected and followed

over time The diverse forms of PED are then described with explanation of how they may hint at the underlying pathology or even be pathognomonic when considered in conjunction with other clinical features New insights are provided into the characteristics of the various forms of PED and predictors of complications such as rip of the PED are discussed It is clearly explained how knowledge of the different types of PED and their underlying diseases can assist in creating an appropriate individualized follow up and therapy scheme for each patient Gass' Atlas of Macular Diseases Anita Agarwal,2011-12-23

The Retinal Pigment Epithelium Michael F. Marmor, Thomas J. Wolfensberger, 1998 The retinal pigment epithelium is a critical tissue within the eye It lies directly behind the retina where it provides metabolic support to the photoreceptors and controls their local environment As a result the RPE is vital to retinal function but also a site of aging and disease that cause dysfunction and visual loss This book brings together comprehensive reviews of basic and clinical science concerning the RPE It is organized to juxtapose chapters on RPE disease with chapters on the underlying pathophysiology These include up to date accounts of growth factors laser effects proliferative vitreoretinopathy Bruch's membrane pathology as well as new diagnostic tools such as ocular coherence tomography in vivo imaging of lipofuscin and non photic electrical responses Other chapters cover pharmacology and toxicology mechanisms of retinal adhesion and detachment RPE pigments and transport congenital and dystrophic diseases animal models of RPE disease and different aspects of age related macular degeneration The history and evolutionary aspects of the RPE are also presented The contributing authors are experienced clinicians and eminent basic scientists who work on this critical part of the eye The book will be a valuable resource for anyone interested in the eye and a necessity for specialists in the fields of retinal physiology and retinal disease
