*Semantic Structures* David L. Waltz, 1989 Focusing on text rather than on isolated sentences this collection examines recent computer programs designed to aid in understanding natural language generation All the systems concentrate on the semantics pragmatics and common sense knowledge necessary to understand summarize and learn new word and phrase definitions from text Special emphasis is given to generating linguistic descriptions from perceptual inputs Issues covered include the representation of episodic and semantic knowledge to support text understanding the generation and verification of inferences from text story understanding and the production of narrative summaries and the interactions of syntax with semantic and common sense *Semantic Structures (RLE Linguistics B: Grammar)* David L. Waltz, 2014-02-03 Natural

language understanding is central to the goals of artificial intelligence Any truly intelligent machine must be capable of carrying on a conversation dialogue particularly clarification dialogue is essential if we are to avoid disasters caused by the misunderstanding of the intelligent interactive systems of the future This book is an interim report on the grand enterprise of devising a machine that can use natural language as fluently as a human What has really been achieved since this goal was first formulated in Turing's famous test What obstacles still need to be overcome **Advanced Video-Based Surveillance**

Lobin, Harald Längen, Angelika Storrer, Andreas Witt, 2011-09-10 Researchers in many disciplines have been concerned with modeling textual data in order to account for texts as the primary information unit of written communication The book *Modelling Learning and Processing of Text Technological Data Structures* deals with this challenging information unit It focuses on theoretical foundations of representing natural language texts as well as on concrete operations of automatic text processing Following this integrated approach the present volume includes contributions to a wide range of topics in the context of processing of textual data This relates to the learning of ontologies from natural language texts the annotation and automatic parsing of texts as well as the detection and tracking of topics in texts and hypertexts In this way the book brings together a wide range of approaches to procedural aspects of text technology as an emerging scientific discipline

Knowledge Representation and the Semantics of Natural Language Hermann Helbig, 2005-12-19 Natural Language is not only the most important means of communication between human beings it is also used over historical periods for the preservation of cultural achievements and their transmission from one generation to the other During the last few decades the flood of digitalized information has been growing tremendously This tendency will continue with the globalization of information societies and with the growing importance of national and international computer networks This is one reason why the theoretical understanding and the automated treatment of communication processes based on natural language have such a decisive social and economic impact In this context the semantic representation of knowledge originally formulated in natural language plays a central part because it connects all components of natural language processing systems be they the automatic understanding of natural language analysis the rational reasoning over knowledge bases or the generation of natural language expressions from formal representations This book presents a method for the semantic representation of natural language expressions texts sentences phrases etc which can be used as a universal knowledge representation paradigm in the human sciences like linguistics cognitive psychology or philosophy of language as well as in computational linguistics and in artificial intelligence It is also an attempt to close the gap between these disciplines which to a large extent are still working separately

**Cognitive Dynamics** Eric Dietrich, Arthur B. Markman, 2014-03-05 Recent work in cognitive science much of

it placed in opposition to a computational view of the mind has argued that the concept of representation and theories based on that concept are not sufficient to explain the details of cognitive processing. These attacks on representation have focused on the importance of context sensitivity in cognitive processing, on the range of individual differences in performance, and on the relationship between minds and the bodies and environments in which they exist. In each case, models based on traditional assumptions about representation have been assumed to be too rigid to account for the effects of these factors on cognitive processing. In place of a representational view of mind, other formalisms and methodologies such as nonlinear differential equations or dynamical systems and situated robotics have been proposed as better explanatory tools for understanding cognition. This book is based on the notion that while new tools and approaches for understanding cognition are valuable, representational approaches do not need to be abandoned in the course of constructing new models and explanations. Rather, models that incorporate representation are quite compatible with the kinds of complex situations being modeled with the new methods. This volume illustrates the power of this explicitly representational approach, labeled cognitive dynamics, in original essays by prominent researchers in cognitive science. Each chapter explores some aspect of the dynamics of cognitive processing while still retaining representations as the centerpiece of the explanations of the key phenomena. These chapters serve as an existence proof that representation is not incompatible with the dynamics of cognitive processing. The book is divided into sections on foundational issues about the use of representation in cognitive science, the dynamics of low-level cognitive processes such as visual and auditory perception and simple lexical priming, and the dynamics of higher cognitive processes including categorization, analogy, and decision making.
