Pattern Detection and Discovery David J Hand,Niall, M. Adams,Richard J. Bolton,2003-08-02 The collation of large electronic

databases of scientific and commercial information has led to a dramatic growth of interest in methods for discovering structures in such databases. These methods often go under the general name of data mining. One important subdiscipline within data mining is concerned with the identification and detection of anomalous, interesting, unusual, or valuable records or groups of records which we call patterns. Familiar examples are the detection of fraud in credit card transactions of particular coincident purchases in supermarket transactions of important nucleotide sequences in gene sequence analysis and of characteristic traces in EEG records. Tools for the detection of such patterns have been developed within the data mining community but also within other research communities typically without an awareness that the same problem was common to many disciplines. This is not unreasonable; each of these disciplines has a large literature of its own and a literature which is growing rapidly. Keeping up with any one of these is difficult enough, let alone keeping up with others as well, which may in any case be couched in a familiar technical language. But of course this means that opportunities are being lost; discoveries relating to the common problem made in one area are not transferred to the other area and breakthroughs and problem solutions are being rediscovered or not discovered for a long time, meaning that effort is being wasted and opportunities may be lost.

Intelligence of Things: Technologies and Applications Nhu-Ngoc Dao, Quang-Dung Pham, Sungrae Cho, Ngoc Thanh Nguyen, 2024-12-23. Robotic Process Automation Christian Czarnecki, Peter Fettke, 2021-05-10. This book brings together experts from research and practice. It includes the design of innovative Robot Process Automation (RPA) concepts, the discussion of related research fields (e.g., Artificial Intelligence, AI), the evaluation of existing software products, and findings from real-life implementation projects. Similar to the substitution of physical work in manufacturing (blue collar automation), Robotic Process Automation tries to substitute intellectual work in office and administration processes with software robots (white collar automation). The starting point for the development of RPA was the observation that despite the use of process-oriented enterprise systems such as ERP, CRM, and BPM systems, additional manual activities are still indispensable today. In the RPA approach, these manual activities are learned and automated by software robots either by defining rules or by observing manual activities. RPA is related to business process management, machine learning, and artificial intelligence. Tools for RPA originated from dedicated stand-alone software. Today, RPA functionalities are also integrated into elaborated process management suites. From a conceptual perspective, RPA can be structured into input components (sensors, in the wide sense) and an intelligence center, and output components (actuators, in the wide sense). From a strategic perspective, the impact of RPA

can be related to the support of existing tasks the complete substitution of human activities and the innovation of processes as well as business models At present high expectations are related to the use of RPA in the improvement of software supported business processes Manual activities are learned and automated by software robots that interact with existing applications via the presentation layer In combination with artificial intelligence AI as well as innovative interfaces e g voice recognition RPA creates a novel level of automation for office and administration processes Its benefit potential reaches a return on investment ROI up to 800% that is documented in various case studies *Proceedings of Second International Conference on Advances in Computer Engineering and Communication Systems* A.
