Restricted Orbit Equivalence For Actions Of Discrete Amenable Groups:

Restricted Orbit Equivalence for Actions of Discrete Amenable Groups Janet Whalen Kammeyer, Daniel J. Rudolph, 2002-04-18 This monograph offers a broad investigative tool in ergodic theory and measurable dynamics The motivation for this work is that one may measure how similar two dynamical systems are by asking how much the time structure of orbits of one system must be distorted for it to become the other Different restrictions on the allowed distortion will lead to different restricted orbit equivalence theories These include Ornstein's Isomorphism theory Kakutani Equivalence theory and a list of others By putting such restrictions in an axiomatic framework a general approach is developed that encompasses all of these examples simultaneously and gives insight into how to seek further applications Ergodic Theory

Meyers, 2011-10-05 Mathematics of Complexity and Dynamical Systems is an authoritative reference to the basic tools and concepts of complexity systems theory and dynamical systems from the perspective of pure and applied mathematics Complex systems are systems that comprise many interacting parts with the ability to generate a new quality of collective behavior through self organization e g the spontaneous formation of temporal spatial or functional structures These systems are often characterized by extreme sensitivity to initial conditions as well as emergent behavior that are not readily predictable or even completely deterministic The more than 100 entries in this wide ranging single source work provide a comprehensive explication of the theory and applications of mathematical complexity covering ergodic theory fractals and multifractals dynamical systems perturbation theory solitons systems and control theory and related topics Mathematics of Complexity and Dynamical Systems is an essential reference for all those interested in mathematical complexity from undergraduate and graduate students up through professional researchers Topological Dynamics and Applications Robert Ellis, Mahesh G. Nerurkar, 1998 This book is a very readable exposition of the modern theory of topological dynamics and presents diverse applications to such areas as ergodic theory combinatorial number theory and

differential equations There are three parts 1 The abstract theory of topological dynamics is discussed including a comprehensive survey by Furstenberg and Glasner on the work and influence of R Ellis Presented in book form for the first time are new topics in the theory of dynamical systems such as weak almost periodicity hidden eigenvalues a natural family of factors and topological analogues of ergodic decomposition 2 The power of abstract techniques is demonstrated by giving a very wide range of applications to areas of ergodic theory combinatorial number theory random walks on groups and others 3 Applications to non autonomous linear differential equations are shown Exposition on recent results about Floquet theory bifurcation theory and Lyapunov exponents is given

Equivalence and Duality for Module Categories with Tilting and Cotilting for Rings Robert R. Colby,Kent R. Fuller,2004-03-22 This book provides a unified approach to much of the theories of equivalence and duality between categories of modules that has transpired over the last 45 years In particular during the past dozen or so years many authors including the authors of this book have investigated relationships between categories of modules over a pair of rings that are induced by both covariant and contravariant representable functors in particular by tilting and cotilting theories By here collecting and unifying the basic results of these investigations with innovative and easily understandable proofs the authors aim is to provide an aid to further research in this central topic in abstract algebra and a reference for all whose research lies in this field

Handbook of Dynamical Systems A. Katok,B. Hasselblatt,2005-12-17 This second half of Volume 1 of this Handbook follows Volume 1A which was published in 2002 The contents of these two tightly integrated parts taken together come close to a realization of the program formulated in the introductory survey Principal Structures of Volume 1A The present volume contains surveys on subjects in four areas of dynamical systems Hyperbolic dynamics parabolic dynamics ergodic theory and infinite dimensional dynamical systems partial differential equations Written by experts in the field The coverage of ergodic theory in these two parts of Volume 1 is considerably more broad and thorough than that provided in other existing sources The final cluster of chapters discusses partial differential equations from the point of view of dynamical systems

Modern Dynamical Systems and Applications Michael Brin,Boris Hasselblatt,Ya. B. Pesin,2004-08-16 This volume presents a wide cross section of current research in the theory of dynamical systems and contains articles by leading researchers including several Fields medalists in a variety of specialties These are surveys usually with new results included as well as research papers that are included because of their potentially high impact Major areas covered include hyperbolic dynamics elliptic dynamics mechanics geometry ergodic theory group actions rigidity applications The target audience includes dynamicists who will find new results in their own specialty as well as surveys in others and mathematicians from other disciplines who look for a sample of current developments in ergodic theory and dynamical systems

Linear and Projective Representations of Symmetric Groups Aleksandr Sergeevich

Kleshchëv,2005-06-30 Kleshchev describes a new approach to the subject of the representation theory of symmetric groups

Lévy Processes in Lie Groups Ming Liao,2004-05-10 The theory of Lévy processes in Lie groups is not merely an extension of the theory of Lévy processes in Euclidean spaces Because of the unique structures possessed by non commutative Lie groups these processes exhibit certain interesting limiting properties which are not present for their counterparts in Euclidean spaces These properties reveal a deep connection between the behaviour of the stochastic processes and the underlying algebraic and geometric structures of the Lie groups themselves The purpose of this work is to provide an introduction to Lévy processes in general Lie groups the limiting properties of Lévy processes in semi simple Lie groups of non compact type and the dynamical behavior of such processes as stochastic flows on certain homogeneous spaces The reader is assumed to be familiar with Lie groups and stochastic analysis but no prior knowledge of semi simple Lie groups is required **Permutation Group Algorithms** Ákos Seress,2003-03-17 Table of contents *The Covering Property Axiom*,

CPA Krzysztof Ciesielski,Janusz Pawlikowski,2004-08-23 Here the authors formulate and explore a new axiom of set theory CPA the Covering Property Axiom CPA is consistent with the usual ZFC axioms indeed it is true in the iterated Sacks model and actually captures the combinatorial core of this model A plethora of results known to be true in the Sacks model easily follow from CPA Replacing iterated forcing arguments with deductions from CPA simplifies proofs provides deeper insight and leads to new results One may say that CPA is similar in nature to Martin's axiom as both capture the essence of the models of ZFC in which they hold The exposition is self contained and there are natural applications to real analysis and topology Researchers who use set theory in their work will find much of interest in this book **Finite Packing and**

Covering K. Böröczky,2004-08-02 This book provides an in depth discussion of the theory of finite packings and coverings by convex bodies **The Lévy Laplacian** M. N. Feller,2005-11-24 The Lévy Laplacian is an infinite dimensional generalization of the well known classical Laplacian The theory has become well developed in recent years and this book was the first systematic treatment of the Lévy Laplace operator The book describes the infinite dimensional analogues of finite dimensional results and more especially those features which appear only in the generalized context It develops a theory of operators generated by the Lévy Laplacian and the symmetrized Lévy Laplacian as well as a theory of linear and nonlinear equations involving it There are many problems leading to equations with Lévy Laplacians and to Lévy Laplace operators for example superconductivity theory the theory of control systems the Gauss random field theory and the Yang Mills equation The book is complemented by an exhaustive bibliography The result is a work that will be valued by those working in functional analysis partial differential equations and probability theory *Ergodic Theory* Manfred Einsiedler,Thomas

Ward,2010-09-11 This text is a rigorous introduction to ergodic theory developing the machinery of conditional measures and expectations mixing and recurrence Beginning by developing the basics of ergodic theory and progressing to describe some recent applications to number theory this book goes beyond the standard texts in this topic Applications include Weyl's

polynomial equidistribution theorem the ergodic proof of Szemerédi's theorem the connection between the continued fraction map and the modular surface and a proof of the equidistribution of horocycle orbits Ergodic Theory with a view towards Number Theory will appeal to mathematicians with some standard background in measure theory and functional analysis No background in ergodic theory or Lie theory is assumed and a number of exercises and hints to problems are included making this the perfect companion for graduate students and researchers in ergodic theory homogenous dynamics or number theory Poincaré Duality Algebras, Macaulay's Dual Systems, and Steenrod Operations Dagmar M. Meyer, Larry Smith, 2005-08-18 A monograph demonstrating remarkable and unexpected interdisciplinary connections in the areas of commutative algebra invariant theory and algebraic topology The Geometry of Total Curvature on Complete Open Surfaces Katsuhiko Shiohama, Takashi Shioya, Minoru Tanaka, 2003-11-13 This is a self contained account of how some modern ideas in differential geometry can be used to tackle and extend classical results in integral geometry The authors investigate the influence of total curvature on the metric structure of complete non compact Riemannian 2 manifolds though their work much of which has never appeared in book form before can be extended to more general spaces Many classical results are introduced and then extended by the authors The compactification of complete open surfaces is discussed as are Busemann functions for rays Open problems are provided in each chapter and the text is richly illustrated with figures designed to help the reader understand the subject matter and get intuitive ideas about the subject The treatment is self contained assuming only a basic knowledge of manifold theory so is suitable for graduate students and non specialists who seek an introduction to this modern area of differential geometry **Harmonic Mappings in the Plane** Peter Duren, 2004-03-29 Harmonic mappings in the plane are univalent complex valued harmonic functions of a complex variable Conformal mappings are a special case where the real and imaginary parts are conjugate harmonic functions satisfying the Cauchy Riemann equations Harmonic mappings were studied classically by differential geometers because they provide isothermal or conformal parameters for minimal surfaces More recently they have been actively investigated by complex analysts as generalizations of univalent analytic functions or conformal mappings Many classical results of geometric function theory extend to harmonic mappings but basic questions remain unresolved This book is the first comprehensive account of the theory of planar harmonic mappings treating both the generalizations of univalent analytic functions and the connections with minimal surfaces Essentially self contained the book contains background material in complex analysis and a full development of the classical theory of minimal surfaces including the Weierstrass Enneper representation It is designed to introduce non specialists to a beautiful area of complex analysis and geometry **Quasi-Frobenius Rings** W. K. Nicholson, M. F. Yousif, 2003-09-08 A ring is called quasi Frobenius if it is right or left selfinjective and right or left artinian all four combinations are equivalent The study of these rings grew out of the theory of representations of a finite group as a group of matrices over a field and the subject is intimately related to duality the duality from right to left modules induced by

the hom functor and the duality related to annihilators The present extent of the theory is vast and this book makes no attempt to be encyclopedic instead it provides an elementary self contained account of the basic facts about these rings at a level allowing researchers and graduate students to gain entry to the field
