

MANAGEMENT INFORMATION SYSTEMS

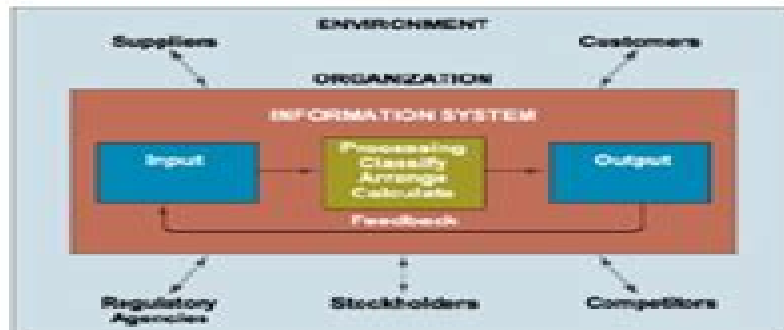

What is an Information System?

An information system can be defined technically as a set of interrelated components that collect (or retrieve), process, store, and distribute information to support decision making, coordination and control in an organization. In addition to supporting decision making, coordination, and control, information systems may also help managers and workers analyze problems, visualize complex subjects, and create new products.

Information systems contain information about significant people, places, and things within the organization or in the environment surrounding it. By information we mean data that have been shaped into a form that is meaningful and useful to human beings.

Functions of an information system

An information system contains information about an organization and its surrounding environment. Three basic activities—input, processing, and output—produce the information organizations need. Feedback is output returned to appropriate people or activities in the organization to evaluate and refine the input. Environmental factors such as customers, suppliers, competitors, stockholders, and regulatory agencies interact with the organization and its information systems.

Why Information Systems?

Today it is widely recognized that information systems knowledge is essential for managers because most organizations need information systems to survive and prosper. Information systems can help companies extend their reach to far away locations, offer new products and services, reshape jobs and work flows, and perhaps profoundly change the way they conduct business.
