Covello, Lester B. Lave, Alan Moghissi, V.R.R. Uppuluri, 2013-03-08 The subject of this volume uncertainties in risk assessment and management reflects an important theme in health safety and environmental decision making Most technological hazards are characterized by substantial uncertainty Recent examples include nuclear waste disposal acid rain asbestos in schools carcinogens in food and hazardous waste dealing with such uncertainty is arguably the most difficult and challenging task facing risk assessors and managers today Four primary sources of uncertainty in risk assessment and management can be identified 1 uncertainties about definitions 2 uncertainties about scientific facts 3

uncertainties about risk perceptions and attitudes and 4 uncertainties about values. Uncertainties about definitions derive primarily from disagreements about the meaning and interpretation of key concepts such as probability. Uncertainties about scientific facts derive primarily from disagreements about failure modes, the probability and magnitude of adverse health or environmental consequences, cause and effect relationships, dose response relationships, and exposure patterns. Uncertainties about risk perceptions and attitudes derive primarily from disagreements about what constitutes a significant or acceptable level of risk. Uncertainties about values derive primarily from disagreements about the desirability or worth of alternative risk management actions or consequences. The papers in this volume address each of these sources of uncertainty from a variety of perspectives. Reflecting the broad scope of risk assessment and risk management research, the papers include contributions from safety engineers, epidemiologists, toxicologists, chemists, biostatisticians, biologists, decision analysts, economists, psychologists, political scientists, sociologists, ethicists, and lawyers.

Regulating Toxic Substances Carl F. Cranor, 1993. This treatise on the legal assessment of risks regarding toxic chemicals addresses the standards of evidence in legal proceedings and the regulatory decisions covering these chemicals.

Ethics of Scientific Research Kristin Shrader-Frechette, 2000-01-01. Challenging long held theories of scientific rationality and remoteness. Kristin Shrader-Frechette argues that research cannot be value free. Rather, any research will raise important moral issues for those involved. Issues not only of truthfulness but of risk to research subjects, third parties, and the general public.

Calculated Risks Joseph V. Rodricks, 1994-01-28. Public concern regarding environmental pollution and chemicals present in foods, consumer products, and the workplace are at an all-time high. Whilst there is widespread awareness, confusion still reigns, aggravated by conflicting reports concerning carcinogens in food and drinking water, or about chemicals present in medicines and household products that may cause birth defects. The effort to understand how these pollutants and chemical products may harm human health is led by scientists in the disciplines of toxicology, epidemiology, and risk assessment. The central purpose of this book is to describe how scientists come to understand the toxic properties of such chemicals and the health risks they

may pose Rather than attempting to expose governmental and corporate ignorance negligence or corruption this book explores the underlying scientific issues It presents a practical and balanced clarification of the scientific basis for our concerns and uncertainties It should serve to refocus the debate
