Management Of Hypertension A Multifactorial Approach:

Management of Hypertension Norman K. Hollenberg, 1987

Combination Therapy in Hypertension Joel M. Neutel, 2013-12-17 For over 30 years the stepped care approach has been used in the management and treatment of hypertension. This approach advocates the use of initial monotherapy to reach the desired blood pressure and the subsequent use of additional drugs with complementary modes of action until the target BP is achieved. However, current control rates for hypertension suggest that such an approach may be outdated and no longer effective in the management of hypertension. Clinical trials have shown that more than 50% of patients require a combination of drug therapies to achieve their target BP. Some proponents of combination therapy have argued that the risk of adverse side effects and non-compliance will be lower than that compared to monotherapy which initially requires higher doses to be administered to be effective. Consequently, there have been increasing calls of the necessity for a much more combined approach in the treatment of hypertension. Adding to this, Combination Therapy in Hypertension will cover current control rates of blood pressure worldwide, the benefits of monotherapy and combination therapy, examine the effectiveness, risk of adverse effects, compliance, and cost of the available therapies, and will also include information on relevant outcome studies.

Evidence-based Management of Hypertension Matthew R. Weir, 2010-09-01 The treatment of hypertension is now evolving into a decision-making process of ever greater complexity. Not only has the range of drugs available increased, but so too has our knowledge of the diversity of individual patients' responsiveness to therapy and the need to tailor their treatment with reference to a wide variety of additional factors. In order to provide effective patient care, the clinician needs to be aware of all the options available, but also of the evidence supporting their use and the extent to which that evidence justifies the choices made. In this new volume, leading authorities in their fields draw on the available evidence to provide answers to a series of key clinical questions facing the clinician treating hypertension: Should we treat prehypertension? How does the choice of therapy change in the presence of comorbidities such as obesity, ischemic heart disease, left ventricular hypertrophy, diabetes, or cerebrovascular disease? Evidence-based Management of Hypertension provides answers to these and many other questions as the authors present an expert analysis of the available evidence and offer authoritative recommendations for treatment planning. In each chapter, tables highlight evidence from a variety of sources, and every chapter concludes with a series of key practice points that present a summary of evidence-based recommendations for best practice, graded according to the quality of that evidence. For any clinician concerned with the care of the hypertensive patient, this volume will be a valuable aid to treatment planning and long-term management.

P. Allison,V. L. W. Go,2004-08-27 As widely spread health problems related to over and undernutrition have grown nowadays to an epidemic

extent and even prevail over infectious diseases a better knowledge of the metabolic basis of clinical nutrition has become essential. The extremes of the nutritional spectrum, undernutrition and obesity, are no longer considered as isolated opposites with different effects on separate risk groups but paradoxically prove to be interacting in a setting of rapidly changing lifestyles as is presently the case worldwide. Recurring issues such as insulin resistance, changes in intermediary metabolism, fluid and electrolyte physiology, genetic and non-genetic inheritance are highlighted as well as the biological linkage between maternal undernutrition and the development of obesity, diabetes and cardiovascular disease in later life. The problems at stake present a new and enormous challenge for future healthcare policies and therefore are better tackled today. This book will be an interesting source of knowledge for internists, family physicians, pediatricians, dietitians, endocrinologists, gastroenterologists and public health officers.

RSSDI Diabetes Update 2020 Banshi Saboo, Ch Vasanth Kumar, Sanjay Agarwal, 2021-03-31. Diabetes mellitus is a group of metabolic diseases in which a person has high blood sugar either because the body does not produce enough insulin or because cells do not respond to the insulin that is produced. The latest edition of this reference provides endocrinologists with the latest advances in the diagnosis and management of diabetes. Beginning with an overview of epidemiology, pathophysiology and metabolism, the next sections discuss presentations of diabetes, therapeutic management, complications and comorbidities. Manual of Nonpharmacological Control of Hypertension J.R. Viskoper, 2012-12-06. The prevention and correction of high blood pressure obviously is not an end in itself but a means of preventing cardiovascular complications. It is tempting to resort to antihypertensive drugs for the simple reason that current preparations are easy to dose and to take. There is a variety of reasons, however, to take advantage of the antihypertensive potential of nonpharmacological approaches first. For one thing, the use of tablets tends to accentuate the negative effects of labelling a subject as hypertensive. The act of taking tablets per se may elicit a spectrum of subjective adverse effects as we have learned from placebo-controlled therapeutic trials. Even more importantly, the benefits of antihypertensive drug treatment are largely confined to the reduction of stroke and disease of the large vessels. With regard to incidence of cardiac events, some modest beneficial effects have been registered such as a decrease in congestive heart failure and in the fatality rate of myocardial infarction. The effects on the incidence of coronary heart disease are only marginal at best. This disappointing finding has been ascribed to various factors: unwanted metabolic effects of anti-hypertensive drugs, inadvertent drops in diastolic pressure interfering with coronary perfusion and last but not least, failure to eliminate risk factors other than high blood

pressure smoking alcohol abuse lipid and glucose disturbances obesity and the hemodynamic disadvantages of a sedentary life Most of these additional noxious factors are refractory to drug treatment and call for modification of life style
