*Cyberspace Mimic Defense* Jiangxing Wu, 2019-12-02 This book discusses uncertain threats which are caused by unknown attacks based on unknown vulnerabilities or backdoors in the information system or control devices and software hardware Generalized robustness

control architecture and the mimic defense mechanisms are presented in this book which could change the easy to attack and difficult to defend game in cyberspace. The endogenous uncertain effects from the targets of the software hardware based on this architecture can produce magic mimic defense fog and suppress in a normalized mode random disturbances caused by physical or logic elements as well as effects of non probability disturbances brought by uncertain security threats. Although progress has been made in the current security defense theories in cyberspace and various types of security technologies have come into being, the effectiveness of such theories and technologies often depends on the scale of the prior knowledge of the attackers on the part of the defender and on the acquired real timing and accuracy regarding the attackers behavior features and other information. Hence there lacks an efficient active defense means to deal with uncertain security threats from the unknown. Even if the bottom line defense technologies such as encrypted verification are adopted, the security of hardware software products cannot be quantitatively designed, verified or measured. Due to the loose coupling relationship and border defense modes between the defender and the protected target, there exist insurmountable theoretical and technological challenges in the protection of the defender and the target against the utilization of internal vulnerabilities or backdoors as well as in dealing with attack scenarios based on backdoor activated collaboration from both inside and outside, no matter how augmented or accumulated protective measures are adopted. Therefore it is urgent to jump out of the stereotyped thinking based on conventional defense theories and technologies, find new theories and methods to effectively reduce the utilization of vulnerabilities and backdoors of the targets without relying on the priori knowledge and feature information and to develop new technological means to offset uncertain threats based on unknown vulnerabilities and backdoors from an innovative perspective. This book provides a solution both in theory and engineering implementation to the difficult problem of how to avoid the uncontrollability of product security caused by globalized marketing COTS and non trustworthy software hardware sources. It has been proved that this revolutionary enabling technology has endowed software hardware products in IT, ICT, CPS with endogenous security functions and has overturned the attack theories and methods based on hardware software design defects or resident malicious codes. This book is designed for educators, theoretical and technological researchers in cyber security and autonomous control and for business technicians who are engaged in the research on developing a new generation of software hardware products by using endogenous security enabling technologies and for other product users. Postgraduates in IT, ICT, CPS, ICS will discover that as long as the law of structure determines the nature and architecture, determines the security is properly used, the problem of software hardware design defects or malicious code embedding will become the swelling of Achilles in the process of informationization and will no longer haunt Pandora's box in cyberspace. Security and opening up, advanced progressiveness and controllability seem to be contradictory but there can be theoretically and technologically unified solutions to the problem.

**Integration and self regulation of quality management in Dutch agri-food supply chains** Wijnand van Plaggenhoef,2023-08-28 During the last decade sector wide crises in agriculture have rapidly followed each other resulting in serious consumer concerns about the quality and safety of agri food products To prevent new crises governments have developed quality regulations and retailers have introduced quality management standards However concerns have been raised about the administrative burdens placed on firms because they must comply with many private and public quality regulations Therefore both government and firms strive for more integration and self regulation of quality management systems By combining managerial and economic theory this study builds a framework to demonstrate the impact of integrated quality management on self regulation and performance Using empirical evidence from the poultry meat the fruit and vegetable and the flower and potted plant chains this study shows that integrated quality management systems positively affect performance and self regulation However it is necessary to find committed partners that share the firm s quality objectives In most cases too strict enforcement of quality requirements is destructive initiates conflict and does not lead to higher performance Furthermore governmental agencies should focus on innovative approaches to assure quality Not legislation but factors such as media attention and corporate social responsibility enlarge the integration of quality management systems This book is recommended for a broad audience of professionals practitioners and policy makers who concern themselves with the design management and assessment of quality management and self regulation in agri food supply chains

*Topics on System Analysis and Integrated Water Resources Management* Andrea Castelletti,Rodolfo Soncini-Sessa,2006-10-19 The Integrated Water Resources Management IWRM paradigm has been worldwide recognized as the only feasible way currently available to ensure a sustainable perspective in planning and managing water resource systems It is the inspiring principle of the Water Framework Directive adopted by the European Union in 2000 as well as the main reference for all the water related activity of UNESCO in the third world countries However very often real world attempts of implementing IWRM fail for the lack of a systematic approach and the inadequacy of tools and techniques adopted to address the intrinsically complex nature of water systems This book explores recent and important contributions of System Analysis and Control Theory to the technical application of such paradigm and to the improvement of its theoretical basis Its prior aim is to demonstrate how the modelling and computational difficulties posed by this paradigm might be significantly reduced by strengthening the efficiency of the solution techniques instead of weakening the integration requirements The first introductory chapter provides the reader with a logical map of the book by formalizing the IWRM paradigm in a nine step decisional procedure and by identifying the

points where the contribution of System Analysis and Control Theory is more useful The book is then organized in three sections whose chapters analyze some theoretical and mathematical aspects of these contributions or presents design applications The outstanding research issues on the border between System Analysis and IWRM is depicted in the last chapter where a pull of scientists and experts coordinated by Prof Tony Jakeman describe the foreseeable scenario The book is based on the most outstanding contributions to the IFAC workshop on Modelling and Control for Participatory Planning and Managing Water Systems held in Venice September 28 October 1 2004 That workshop has been conceived and organized with the explicit purpose of producing this book the maximum length of the papers was unusually long of the size of a book chapter and only five long oral presentations were planned each day thus allowing for a very useful and constructive discussion Contributions from the leading world specialists of the field Integration of technical modelling aspects and participatory decision making Good compromise between theory and application
