*Computational Drug Discovery of Medicinal Compounds for Cancer Management* Sibghatulla Shaikh, Khurshid Ahmad, Mohammad Ehtisham Khan, Faez Iqbal Khan. Cancer is still a major public health concern and it is regarded as one of the leading causes of mortality globally. Despite significant advances in biotechnologies, developing practical and innovative small molecule drugs remains a difficult, time consuming and expensive task that necessitates collaborations from many experts in multidisciplinary fields such as computational biology, drug metabolism and clinical research among others. Therefore, new drug development procedures that save time and cost while increasing

efficiency are in high demand In silico screening in combination with molecular simulations has become an increasingly important aspect of modern drug development processes Understanding ligand protein interaction is critical in all areas of drug design and discovery Computational approaches such as molecular docking molecular dynamics simulations pharmacophore modeling and QSAR etc are efficient tools for obtaining insights on structure function relationships for small molecules and or medicinal compounds with target proteins and are widely used in the identification and optimization of leads The goal of the drug discovery process is to predict a drug candidate s metabolic fate in order to build a link between pharmacodynamics and pharmacokinetics and to identify the drug candidate s possible toxicity The advancement of in silico techniques in recent years has enabled researchers to collect more trustworthy data This Research Topic will focus on the use and application of computational methods that can aid in the drug design of medicinal compounds targeting various proteins for cancer management which is a critical requirement in the pharmaceutical sectors

The incidence is showing an increasing trend affecting younger women and the cost to prevent, treat and manage this chronic disease is continuously escalating. Universal Health Coverage (UHC) is an initiative by the World Health Organisation that encourages policy makers in all countries in the world to organise their health systems that are responsive in providing access to quality health care to every citizen in need of health services without facing the financial hardship. Malaysia's health system has been well developed and was said to have achieved universal health coverage based on the easy access to primary and secondary health care services in the public sector. In this book, we present our effort to assess if Malaysia provides UHC for preventive, curative and palliative care for breast cancer patients. At the inception of the study, we embarked on the development of a composite index to assess the overall status of UHC. This is followed by an extensive research to explore the extent of financial coverage for management of breast cancer. Over 300 patients in various stages of the breast cancer attending the selected public tertiary hospitals were interviewed and their medical records reviewed to assess their health spending and to estimate the incidence of catastrophic health expenditure. The book is the first of its kind that provides comprehensive real world data on universal coverage for breast cancer patients in the world.
