Molecular Aspects Of Papovaviruses:

Molecular Aspects of Papovaviruses Y. Aloni, 2012-12-06 It is almost twenty years since the first DNA tumor virus meeting was held at Cold Spring Harbor. At this meeting studies on three tumor viruses were discussed: the papovaviruses, the adenoviruses, and the herpesviruses. The present series *Developments in Molecular Virology* chose to reverse this sequence by first publishing books on the herpesviruses followed by adenoviruses and only now the papovaviruses. All the DNA tumor viruses gained their original reputation by serving as model systems in animal cells for studying gene expression and gene regulation, but SV40 and polyoma have been the jewel in the crown in these studies. As a phage was for the study of prokaryotes, SV40 was the first DNA tumor virus to be completely sequenced that enabled the definition of the cis controlling elements in DNA replication and transcription. I am continuously fascinated by the organization of the SV40 and polyoma genomes. Although they contain about 5000 bp that encode for only 6 to 7 proteins, the mechanisms which regulated their gene expression are varied and include almost any other type of gene regulation found today to regulate eukaryotic genes. Just to mention two: i) the early promoter is a classical promoter that contains the TATA, CAAT, and enhancer elements, while the late promoter is devoid of these elements; and ii) the mRNA can be structurally and functionally monocistronic or dicistronic. This hints at the versatility in the control of gene expression at the transcriptional and translational levels.

Clinical and Molecular Aspects of Neurotropic Virus Infection Donald H. Gilden, Howard L. Lipton, 2012-12-06 In the summer of 1984 both of us were working with Professor Yechiel Becker in the Laboratory for Molecular Virology at the Hebrew University Hadassah Medical center in Jerusalem. During a discussion about the increasing number of specialized journals and monographs, Dr. Becker pointed out that none covered both the clinical and molecular aspects of neurotropic virus infections, and he urged us to develop such a book with the help of colleagues who were conducting highly regarded research in their individual areas related to neurotropic viruses. The responses to our request were gratifying, and each contribution provided both a comprehensive clinical description of the neurologic disease produced by a specific virus and an up-to-date review of the current research in the pathogenesis of the disease, with particular attention given to molecular mechanisms. Most but not all chapters were written by clinical neurologists who applied basic science strategies and methodologies to the question of how neurotropic viruses produce disease; other chapters were written by virologists known for their longstanding commitment and expertise in the analysis of the pathogenesis of neurotropic virus infections. Thus, this unique monograph should be valuable to all clinicians caring for patients with CNS viral diseases and to neurovirologists needing an update of the clinical and molecular pathogenesis of neurotropic virus infections. While this monograph was being prepared, a rapidly expanding literature indicated that the human lentiviruses, human immunodeficiency viruses (HIV) and HTLV-1 were highly neurotropic. *Clinical Aspects of Interferons* Michel Revel, 2012-12-06 *Maedi-Visna and Related Diseases* G. Pétursson, R. Hoff-Jørgensen, 2012-12-06 G. Petursson and Rikke Hoff-Jørgensen The concept of slow viral

infections was first put forward in 1954 by Dr Bjorn Sigurdsson an Icelandic physician who had been studying some sheep diseases which were introduced into Iceland with the importation of a foreign breed of sheep in 1933 Sigurdsson's main criteria for defining slow infections were a very long initial period without clinical signs lasting months or even years following infection and a rather regular protracted progressive course once clinical symptoms had appeared usually ending in serious disease or death Sigurdsson included in this list of slow infections maedi visna infectious adenomatosis of sheep scrapie in sheep Bittner's mammary carcinoma and Gross leukemia in mice All of these diseases except scrapie are caused by retroviruses The characteristics of slow infections as described above are of practical importance for epidemiology diagnosis and control of these diseases For many years the slow infections remained primarily a veterinary problem mainly affecting sheep and goats in certain countries In recent years however the human immunodeficiency virus HIV causing acquired immunodeficiency syndrome AIDS has suddenly appeared in many countries of the world and brought the slow infection concept forcefully to the attention of the medical profession The disease problems and the economic effects of slow infections of sheep and goats are increasingly recognized in various countries For the reasons stated above we feel that this book should be useful for veterinarians and physicians alike *Herpesvirus Diseases of Cattle, Horses, and Pigs* G.

Herpesviruses, the Immune System, and AIDS Yechiel Becker, 2012-12-06 **Newcastle**

Disease D. J. Alexander, 2012-12-06 Most of the chapters of this book were written during 1987 which was the Diamond Jubilee year of the publication of the first reports of Newcastle disease in 1927 During the intervening years the nature of the Poultry Industry throughout the World has changed or is in the process of changing dramatically from one based on small village or farm flocks frequently kept as a sideline to an industry based on large flocks sometimes consisting of hundreds of thousands of birds run by multinational companies To all these flocks both large and small Newcastle disease poses a considerable threat to their well being and profitability and it is not unreasonable to state that hardly a single commercial flock of poultry is raised in the world without Newcastle disease having some effect due to actual disease prophylactic vaccination or restrictions placed on rearing movement processing sale or export of birds and products In addition recent years have produced developments in virology and associated biological technology which would have been unbelievable when Newcastle disease virus was first isolated The economic importance of Newcastle disease virus and its use as a laboratory model has meant that major advances have been quickly applied to the field situation whenever possible and as a result a much fuller understanding not only of the biochemistry and basic virology of the virus but also the ecology epizootiology antigenicity immunology and other important aspects in the control of the disease has been achieved

Charlton, 2012-12-06 Rabies is an ancient disease and a fearsome one Although it may not have the economic or public health importance of some other infectious diseases few are so well known or carry the same emotional impact Mainly transmitted

by the bite of an enraged animal and with practically no hope for recovery among those afflicted it has provided the substance of stories and legends throughout the ages The pioneering work of many 19th century workers culminating in the development of the first rabies vaccines by Louis Pasteur provided the ground work for the modern era in the study of rabies Since then and particularly in the last quarter century considerable advances have been made in our knowledge of the nature of the infectious agent its mode of transmission and pathogenetic mechanisms Yet even today much remains to be learned about the disease For example although effective vaccines exist for humans and other animals there is still no known practical cure once the neurological disease symptoms develop Markers of virulence have been mapped at the molecular level but it is yet unclear as to how rabies virus actually exerts its pathological effects Analysis of the Early Transcriptional Regulatory Region of the Human Papovavirus, BK, Strain PQ Anne T. Subject access A-H** , 1992 Immunology of Human Infection André J. Nahmias, Richard J. O'Reilly, 2012-12-06 When we were first approached by the senior editors of this series to edit a book on interactions between the host and infectious agents we accepted this offer as an exciting challenge The only condition readily agreed upon was that such a book should focus on the immunology of infections in humans Our reasons if not biases were severalfold We sensed that the fields of microbiology and immunology which had diverged as each was focusing on its individual search were coming together In agreement with the opinions expressed by Dr Richard Krause in the Introduction we strongly believed that the development of the immune system evolved in response to infectious agents and that the evolution of these agents was influenced in turn by the character of the host's responses An intensive examination of the multitude of primitive or more recently developed host defense mechanisms to determine their relative contribution to man's resistance to a given infectious agent appeared to us to be of crucial basic and practical interest Many immune mechanisms studied in animals were being explored in humans and it appeared timely to focus particularly on what was known about man's resistance to infectious agents correlating this information with lessons learned from relevant experiments in animal models *Viral Tumorigenesis Report* , **The Molecular Basis of Viral Replication** R. Bercoff, 2012-12-06 the discovery of the splicing of the gene transcripts the list would include the whole molecular genetics of the lambda bacteriophage the notions of promoter repressor and integration the discovery of the reverse flow of genetic information the very existence of oncogenes the 5' terminal cap structure of eukaryotic mRNAs Electron microscopy ultracentrifugation and tissue culture were the landmarks on the way of the young science During the past few years however a major and not so silent revolution took place recombinant DNA technology with all its might entered in our laboratories and restriction mapping of cloned genomes and sequencing gels have replaced plaque counting and sucrose gradients The new techniques have made it possible to dissect the entire genome of a virus at the molecular level and studies that would have been dreamt

of just in the mid seventies became the everyday experiments of our days With new insight into the structure of viral genomes and a deeper understanding of the mechanisms that regulate their expression our view of viruses was bound to change this volume bears witness to this impressive advance **Biomedical Index to PHS-supported Research** ,1987
