Molecular and Cellular Mechanisms in Disease J.L. VanLancker, 2012-12-06 In spite of ingenious experiments imaginative theories and unshakable faith in supreme forces there is no way to know how life began What is certain is that in the course of the development of the universe existing sources of energy fused to generate atoms and atoms mingled to become small molecules At some point by chance or design according to one's belief but no one's evidence small molecules such as hydrogen oxygen carbon dioxide water and ammonia reacted to yield larger molecules with the property most essential to life self replication Such molecules had to achieve a proper balance between the stability needed for their survival in the environment and the mutability for the generation of many forms of life How amino acids were created or how DNA RNA and proteins developed remains a mystery But we know that a simple core of nucleic acid embedded in a protein coat made the simplest unit of life except for viroids Whether viruses are a primitive or degenerated form of life is not known Once proteins appeared their great structural plasticity allowed them to react with other elements such as sulfur iron copper and zinc After an incalculable number of years some of the proteins became capable of catalyzing the synthesis of new nucleic acids new proteins and other compounds such as polysaccharides and lipids
