Molecular Phylogeny And Evolution Of Carabid Ground Beetles:

Molecular Phylogeny and Evolution of Carabid Ground Beetles Syozo Osawa,Z.-H. Su,Y. Imura,2004-01-23 Carabid ground beetles sometimes called walking jewels are among the most thoroughly investigated insects in the world This book presents the results of molecular phylogenetic analyses of 2000 specimens including 350 species and that cover more than 90% of the known genera from 500 localities in 35 countries These comprehensive analyses using mitochondrial DNA based dating suggest that carabid diversification took place about 40 to 50 million years ago as an explosive radiation of the major genera coinciding with the collision of the Indian subcontinent and Eurasian land mass The analyses also lead to surprising conclusions suggesting discontinuous evolution and parallel morphological evolution With numerous color illustrations this book presents readers with the dynamic principles of evolution and the magnificent geographic history of the earth as revealed by the study of beetles

Evolutionary Biology of Carabus Ground Beetles Teiji Sota,2021-11-24 This book presents the whole picture of the ecological and evolutionary study on the ground beetle group the subgenus Ohomopterus of the genus Carabus endemic to Japan This flightless beetle group consists of many geographic races They show divergence in key traits for reproductive isolation body size and genital morphology which leads to coexistence of two or more species This beetle group provides an important material to study how a lineage of organisms diversify and form multi species assemblage and thereby multiply their species richness The book introduces novel genomic approaches to resolve questions about evolution of Ohomopterus The readers will find that this story of evolution in Carabus beetles revealed by recent approaches is much different from what was told in previous literature Exploring different cases across a wide range of lineages is important in constructing a synthetic theory of species radiation and richness including speciation and species coexistence This study on Ohomopterus beetles contributes to the ongoing discussion to understand how and why species multiply and how species richness increases in one area of our planet

Proceedings of a symposium honoring the careers of Ross and Joyce Bell and their contributions to scientific work. Burlington, Vermont, 12-15 June 2010 Terry L.

Erwin, 2011-11-16 On the occasion of the 80th birthday of Ross T Bell Professor Emeritus of Entomology at the University of Vermont his colleagues and former students staged a Festschrift in his honor that included his wife and oft times co author Joyce Bell Two days of scientific presentations and a field day resulted in twenty six manuscripts on such diverse organisms as Coleoptera Collembola and Diptera and in such disparate fields as taxonomy phylogeny ecology with a sprinkling of natural history and cyberinfrastructure Mostly the theme of the papers focus on the beetle family Carabidae on which the Bells spent a number of decades in pursuit of information on taxonomy and biology particularly for the wrinkled bark beetles the rhysodines Twenty six scientific contributions make up this volume and they are introduced by the preface and first two papers on the Bells themselves and their other contributions to teaching and natural history studies in the environs of Burlington Vermont

Insect Predators in Pest Management Omkar, 2023-05-24 Pests cause damage to the economic value of crops and stored products while vectors are responsible for the transmission of disease causing agents in human beings and livestock Although application of synthetic pesticides in agriculture gives immediate relief it also causes well known side effects leading to a consensus among entomologists and agriculturists to shift towards other ecofriendly pest management methods Natural enemies of insects including their predators parasitoids and pathogens have attracted the attention of scientists across the globe These natural enemies exist in agroecosystems and suppress the populations of pests Parasitoids are farmers friends and the most successful group of natural enemies Highly specialized generalized in their prey choice active stages of predators search for a suitable prey attack or kill the prey and consume prey within a short handling time Predatory ability is known to increase with increase in prey density A single predator may devour several prey individuals Exploiting this potency of parasitoids may yield successful results in controlling notorious pests in an ecofriendly way This book provides information on the important biocontrol agents that are effective in pest suppression It starts with insect parasitic groups followed by specific group of parasitoids It is hoped that the book presents a comprehensive account of beneficial parasitoids and will be useful to undergraduate and postgraduate students of Entomology Biological Control Plant Protection Agricultural Zoology and Zoology besides those involved in competitive examinations and policy planning Features Each chapter has been authored by specialized senior professionals Every chapter contains Learning Objectives and Points to Remember This book offers comprehensive knowledge of parasitoids and their application in pest management in a lucid way
