Epigenetics and Chromatin Philippe Jeanteur, 2008-09-10 Epigenetics refers to heritable patterns of gene expression which do not depend on alterations of genomic DNA sequence This book provides a state of the art account of a few selected hot spots by scientists at the edge in this extremely active field It puts special emphasis on two main streams of research One is the role of post translational modifications of proteins mostly histones on chromatin structure and accessibility The other one deals with parental genomic imprinting a process which allows to express a few selected genes from only one of the parental allele while extinguishing the other

Guidance Cues in the Developing Brain Ivica Kostovic, 2003-03-24 Many complex molecular interactions are involved in the development of the mammalian brain Molecules serving as guidance cues for migratory cells growing axons and for recognition of postsynaptic targets are a major topic for research because they are directly involved in the formation of neuronal circuits thus creating the foundation for subsequent functional refinement through interactions with the environment In addition most guidance cue molecules are also involved in plasticity damage repair and regeneration in the adult brain This volume reviews current knowledge on major classes of molecules involved in guidance of growing axons tau proteins involved in the establishment of axonal polarity outgrowth and contact recognition gangliosides and lectins involved in neuronal migration neurite outgrowth and contact recognition and myelin molecules that inhibit nerve regeneration

Regulation of Alternative Splicing Philippe Jeanteur, 2013-03-14 The discovery in 1977 that genes are split into exons and introns has done away with the one gene one protein dogma Indeed the removal of introns from the primary RNA transcript is not necessarily straightforward since there may be optional pathways leading to different messenger RNAs and consequently to different proteins Examples of such an alternative splicing mechanism cover all fields of biology Moreover there are plenty of occurrences where deviant splicing can have pathological effects Despite the high number of specific cases of alternative splicing it was not until recently that the generality and extent of this phenomenon was fully appreciated A superficial reading of the preliminary sequence of the human genome published in 2001 led to the surprising and even deceiving to many scientists low number of genes around 32 000 which contrasted with the much higher figure around 150 000 which was previously envisioned Attempts to make a global assessment of the use of alternative splicing are recent and rely essentially on the comparison of genomic mRNA and EST sequences as reviewed by Thanaraj and Stamm in the first chapter of this volume Most recent estimates suggest that 40 60% of human genes might be alternatively spliced as opposed to about 22% for *C elegans*

Biology of Aging Alvaro Macieira-Coelho, 2012-12-06 The survival of the human species has improved significantly in modern times During the last century the mean survival of human populations in developed countries has increased more than during the preceding 5000 years This improvement in survival was accompanied by an increase in the number of active years In other words the increase in mean life span was accompanied by an increase in health span This is now accentuated by progress in medicine reducing the impact of physiologic events such as

menopause and of pathological processes such as atherosclerosis Up to now research on aging whether theoretical or experimental has not contributed to improvement in human survival Actually there is a striking contrast between these significant modifications in survival and the present knowledge of the mechanisms of human aging Revealed by this state of affairs are the profound disagreements between gerontologists in regard to the way of looking at the aging process The definition of aging itself is difficult to begin with because of the variability of how it occurs in different organisms

Invertebrate Cytokines and the Phylogeny of Immunity Alain Beschin, Werner E. G. Müller, 2012-12-06 Based on the assumption that invertebrates as well as vertebrates possess factors regulating hematopoiesis response to infection or wounding studies dealing with the evolution of immunity have focused on the isolation and characterization of putative cytokine related molecules from invertebrates Until recently most of our knowledge of cytokine and cytokine receptor like molecules in invertebrates has relied on functional assays and similarities at the physicochemical level As such a phylogenetic relationship between invertebrate cytokine like molecules and invertebrate counterparts could not be convincingly demonstrated In the present book recent studies demonstrating cytokine like activities and related signaling pathways in invertebrates are critically reviewed focusing on findings from molecular biology and taking advantage of the completion of the genome from the fly *Drosophila* and the worm *Caenorhabditis elegans*

Advances in Enzymology and Related Areas of Molecular Biology Wiley, 2004-04-12 The Advances in Enzymology and Related Areas of Molecular Biology series is one of the most prestigious in the field devoted to the latest trends in molecular biology and enzymology Each volume of the series contains contributions from leading authorities in the field This volume contains the cumulative subject indices for Volume 1 74 in the series making it an invaluable tool for researchers in the field

Advances in Sponge Science: Physiology, Chemical and Microbial Diversity, Biotechnology Mikel A. Becerro, 2012-07-30 The authors have intended to make the forefront of sponge research easily accessible to the nonspecialist illustrating the state of the art of the field and presenting current controversial issues For the specialist we wanted this monograph to be a handy valuable update on the most recent advances in sponge science p x

Subject Guide to Books in Print, 1997 **Protein Degradation in Health and Disease** Michèle Reboud-Ravaux, 2002 Protein degradation has been identified as a major mechanism for the regulation of cellular functions Not surprisingly its deregulation is implied in almost any pathological condition This book describes how aged proteins are eliminated during cell metabolism how cell proliferation is regulated by protein degradation and how its deregulation can contribute to the development of cancer how protein degradation is modified during normal and abnormal aging in particular with regard to Alzheimer's disease and other degenerative diseases of the brain and central nervous system Attempts aiming at correcting these pathologies by interfering with deviations of the normal pathway of protein degradation are also treated

Cellular Ageing and Replicative Senescence Suresh I.S. Rattan, Leonard Hayflick, 2016-05-09 This book covers the origins and subsequent history of research results in which

attempts have been made to clarify issues related to cellular ageing senescence and age related pathologies including cancer Cellular Ageing and Replicative Senescence revisits more than fifty five years of research based on the discovery that cultured normal cells are mortal and the interpretation that this phenomenon is associated with the origins of ageing The mortality of normal cells and the immortality of cancer cells were also reported to have in vivo counterparts Thus began the field of cytoogerontology Cellular Ageing and Replicative Senescence is organized into five sections history and origins serial passaging and progressive ageing cell cycle arrest and senescence system modulation and recapitulation and future expectations These issues are discussed by leading thinkers and researchers in biogerontology and cytoogerontology This collection of articles provides state of the art information and will encourage students teachers health care professionals and others interested in the biology of ageing to explore the fascinating and challenging question of why and how our cells age and what can and cannot be done about it

Chemical and Cellular Architecture Abel Lajtha, 2013-04-18 After the completion of the first edition of this series this editor thought that a new edition would not be warranted in less than IS perhaps 20 years but it seems that we live in a time in which rapid changes are the norm and findings in a field such as neurochemistry develop exponentially The task of a future editor attempting to get a comprehensive neurochemical handbook for the year 2000 would be even less enviable but by then information processing may be very different The approach the design and the areas covered by each volume and each chapter are necessarily arbitrary and it is likely that other editors or authors would have approached the coverage or the organization in a different manner It is hoped however that readers will find the series helpful for beginning or for continuing work There may be some overlap among the various chapters but insisting on single coverage of an area would at times have restricted treatment to only one point of view and might have truncated and hurt the logical flow of some of the chapters

New Advances in Saccharomyces Antonio Morata, Carmen González, Carlos Escott, Iris Loira, 2024-02-07 New Advances in Saccharomyces is a book for yeast researchers that provides a better understanding of yeast metabolism genetics and metabolomics applied to the fermentation of alcoholic beverages such as wine and beer The book is structured in three parts and twelve chapters with a significant focus on wine biotechnology It includes numerous figures and tables with many practical data illustrating the contents and applications This book is designed to help researchers and scientists develop or improve applications and new processes in fermentation industries for the production of beverages
