

The Molecular Basis of Heredity

The **central dogma** of molecular biology is that information is transferred from DNA to RNA to protein, in a process called **gene expression**.

One of the most interesting discoveries of molecular biology is the near-universal nature of the genetic code.

Although some organisms show slight variations in the amino acids assigned to particular codons, the code is always read three bases at a time and in the same direction.

Despite their enormous diversity in form and function, living organisms display remarkable unity at life's most basic level, the molecular biology of the gene.

Molecular Genetics Ray Arters, Molecular genetics represents the convergence of genetics and biochemistry revealing how genetic information is encoded stored and expressed at the molecular level through the remarkable properties of DNA RNA and proteins This field has transformed our understanding of heredity from abstract concepts of inheritance to detailed knowledge of the molecular mechanisms that govern the transmission and expression of genetic traits across generations The discovery of DNA as the molecular basis of heredity emerged from elegant experiments that demonstrated the transformative power of this molecule beginning with Frederick Griffith s transformation experiments and culminating in the demonstration by Oswald Avery Colin MacLeod and Martha Chase that DNA not protein serves as the hereditary material These foundational studies established that genetic information could be transferred between organisms through specific molecular substances laying the groundwork for modern molecular genetics DNA structure elucidated by James Watson and Francis Crick through X ray crystallography data from Rosalind Franklin revealed the double helix architecture that immediately suggested mechanisms for both replication and information storage The antiparallel arrangement of complementary strands held together by specific base pairing between adenine and thymine and guanine and cytosine provided the chemical basis for genetic stability while enabling the template directed synthesis required for
