

THE EUKARYOTIC CELL CYCLE IS REGULATED BY A MOLECULAR CONTROL SYSTEM

- A **tumor** is a mass of abnormal cells within otherwise normal tissue.
- If the abnormal cells remain at the original site, the lump is called a **benign tumor**.
- A **malignant tumor** becomes invasive enough to impair the functions of one or more organs. An individual with a malignant tumor is said to have cancer.
- **Metastasis** occurs when cells separate from a malignant tumor and enter blood or lymph vessels and travel to other parts of the body.

Molecular Control Of Blood Cells:

The Molecular Control of Blood Cells Donald Metcalf,1990 The Molecular Control of Blood Cells Donald Metcalf,1988

This book presents a masterful overview of the mechanics of blood cell formation and the factors that control blood cell growth. Cells circulating in the blood perform functions essential for the survival of organisms yet blood cells and associated blood cell forming hemopoietic tissues have certain features that make them quite different from other vital organs in the body. These features include the short life span of mature blood cells, the multiplicity of blood cell types and the wide dispersion of hemopoietic tissue in the body. The regulation of hemopoiesis in response to emergencies such as blood loss or infections is an exceedingly complex process. However, our knowledge of hemopoietic growth factors, known generally as colony stimulating factors or CSFs, has made exciting advances in recent years. This book provides a leading authority's review of the purification and cloning of CSFs and their actions in regulating white blood cell production in the body. Donald Metcalf also examines the role of CSFs in controlling resistance to infections and in the initiation and suppression of myeloid leukemia. Metcalf's involvement at the center of this research from its inception to the present day enables him to give a historical view as well as a lucid summary of recent research. In addition, he addresses the broader question of the relation between growth control and cancer development. This excellent synopsis should be of particular interest to hematologists, virologists, general clinicians and medical students.

Anti-VEGF Francesco Bandello, Maurizio Battaglia Parodi, A. J. Augustin, 2010-01-01. The development of therapy with anti-angiogenics or vascular endothelial growth factor inhibitors anti-VEGF has marked the beginning of a new era in neovascularization and macular edema treatment. Its main goals are the inhibition of growth and development of new vessels along with the reduction of vascular permeability. The advantages over conventional laser photocoagulation are evident as laser treatment always leaves scars and causes a retinal sensitivity deterioration. Starting with an outline of treatment principles, this volume covers all aspects of anti-VEGF therapy for ophthalmological disorders. In particular, specific chapters are dedicated to age-related macular degeneration, degenerative myopia, angioid streaks, inflammatory diseases, hereditary dystrophies, retinal vein occlusion, diabetic retinopathy, ocular tumors, as well as anterior segment neovascularization. The book gives an update on the application of anti-VEGF in ocular diseases to general ophthalmologists as well as retina specialists.

Advances in Cancer Research, 1995-05-25. ADVANCES IN CANCER RESEARCH is a biannual publication that includes timely reviews on the most cutting edge issues in cancer research. Volume 66 contains encompassing overviews of p53 and its role in both breast cancer and in the cell cycle. Approximately 50% of all human tumors involve mutations of the p53 gene, suggesting that proper understanding of its properties and mechanisms could offer real hope for finding successful clinical therapy. Other themes presented in Volume 66 include cyclins and cyclin dependent kinases in the cell.
