## **Molecular Diversity In Drug Design:**

*Molecular Diversity in Drug Design* P.M. Dean, R.A. Lewis, 2007-05-08 High throughput screening and combinatorial chemistry are two of the most potent weapons ever to have been used in the discovery of new drugs. At a stroke it seems to be possible to synthesise more molecules in a month than have previously been made in the whole of the distinguished history of organic chemistry. Furthermore all the molecules can be screened in the same short period. However like any weapons of immense power these techniques must be used with care to achieve maximum impact. The costs of implementing and running high throughput screening and combinatorial chemistry are high as large dedicated facilities must be built and staffed. In addition the sheer number of chemical leads generated may overwhelm the lead optimisation teams in a hail of friendly fire. Mother nature has not entirely surrendered as the number of building blocks that could be used to build libraries would require more atoms than there are in the universe. In addition the progress made by the Human Genome Project has uncovered many proteins with different functions but related binding sites creating issues of selectivity. Advances in the new field of pharmacogenomics will produce more of these challenges. There is a real need to make high throughput screening and combinatorial chemistry into smart weapons so that their power is not dissipated. That is the challenge for modellers, computational chemists, cheminformaticians and IT experts. In this book we have broken down this grand challenge into key tasks.

*Computer Applications in Pharmaceutical Research and Development* Sean Ekins, 2006-06-30

A unique holistic approach covering all functions and phases of pharmaceutical research and development. While there are a number of texts dedicated to individual aspects of pharmaceutical research and development, this unique contribution takes a holistic and integrative approach to the use of computers in all phases of drug discovery, development and marketing. It explains how applications are used at various stages, including bioinformatics, data mining, predicting human response to drugs and high throughput screening. By providing a comprehensive view, the book offers readers a unique framework and systems perspective from which they can devise strategies to thoroughly exploit the use of computers in their organizations during all phases of the discovery and development process. Chapters are organized into the following sections: Computers in pharmaceutical research and development, a general overview; Understanding diseases, mining complex systems for knowledge; Scientific information handling and enhancing productivity; Computers in drug discovery; Computers in preclinical development; Computers in development decision making, economics and market analysis; Computers in clinical development; Future applications and future development. Each chapter is written by one or more leading experts in the field and carefully edited to ensure a consistent structure and approach throughout the book. Figures are used extensively to illustrate complex concepts and multifaceted processes. References are provided in each chapter to enable readers to continue investigating a particular topic in depth. Finally, tables of software resources are provided in many of the chapters. This is essential reading for IT professionals and scientists in the pharmaceutical industry as well as researchers involved in informatics and ADMET drug discovery and technology development. discovery informatics 3 which takes into account that gaining knowledge from chemical data alone is not sufficient to be ultimately successful in drug discovery Such insights are well in accord with other views that the boundaries between bio and chemoinformatics are fluid and that these disciplines should be closely combined or merged to significantly impact biotechnology or pharmaceutical research 4      **Artificial Intelligence in the Age of Nanotechnology** Jaber,
