

Molecules in Strong Laser Fields

- To what extent do inner-orbitals play a role in the strong-field interaction?
- Can we learn anything about the structure of molecular orbitals with strong laser fields?

- *Clearly, under certain circumstances inner-orbital ionization is important but, first, we need to understand which orbitals are involved.*

Laser Control of Atoms and Molecules V. S. Letokhov, 2007-02-15 This text treats laser light as a universal tool to control matter at the atomic and molecular level one of the most exciting applications of lasers Lasers can heat matter cool atoms to ultra low temperatures where they show quantum collective behaviour and can act selectively on specific atoms and molecules for their detection and separation

High-Resolution Experiments on Strong-Field Ionization of Atoms and Molecules Lutz Fechner, 2016-04-26 In this thesis the ionization of atoms and small molecules in strong laser fields is experimentally studied using a reaction microscope The population of autoionizing doubly excited states in the laser fields is proven and a possible connection to the well known dielectronic recombination processes is discussed The fundamental process of tunnel ionization in strong laser fields is subject of investigation in a pump probe experiment with ultrashort laser pulses A coherent superposition of electronic states in singly charged argon ions is created within the first and subsequently tunnel ionized with the second pulse This gives access to state selective information about the tunneling process and allows to test common models Moreover the ionization of krypton and argon at different wavelengths is studied from the multiphoton to the tunneling regime The wavelength dependent investigations are furthermore extended to molecular hydrogen In addition to ionization this system might undergo different dissociative processes Channel selective electron momentum distributions are presented and compared to each other

Resolving Strong Field Dynamics in Cation States of CO₂ via Optimised Molecular Alignment Malte Oppermann, 2014-04-01 This thesis presents an experimental study of the ultrafast molecular dynamics of CO₂ that are induced by a strong near infrared femtosecond laser pulse In particular typical strong field phenomena such as tunneling ionisation nonsequential double ionisation and photo induced dissociation

are investigated and controlled by employing an experimental technique called impulsive molecular alignment. Here a first laser pulse fixes the molecule in space such that the molecular dynamics can be studied as a function of the molecular geometry with a second laser pulse. The experiments are placed within the context of the study and control of ultrafast molecular dynamics where sub femtosecond 10⁻¹⁵ seconds resolution in ever larger molecular systems represents the current frontier of research. The thesis presents the required background in strong field and molecular physics femtosecond laser architecture and experimental techniques in a clear and accessible language that does not require any previous knowledge in these fields.

Strong Field Laser Physics Thomas Brabec, 2008-09-10 Due to the rapid progress in laser technology a wealth of novel fundamental and applied applications of lasers in atomic and plasma physics have become possible. This book focuses on the interaction of high intensity lasers with matter. It reviews the state of the art of high power laser sources intensity laser atom and laser plasma interactions laser matter interaction at relativistic intensities and QED with intense lasers.

Attosecond and Strong-Field Physics C. D. Lin, Anh-Thu Le, Cheng Jin, Hui Wei, 2018-05-10 Probing and controlling electrons and nuclei in matter at the attosecond timescale became possible with the generation of attosecond pulses by few cycle intense lasers and has revolutionized our understanding of atomic structure and molecular processes. This book provides an intuitive approach to this emerging field utilizing simplified models to develop a clear understanding of how matter interacts with attosecond pulses of light. An introductory chapter outlines the structure of atoms and molecules and the properties of a focused laser beam. Detailed discussion of the fundamental theory of attosecond and strong field physics follows including the molecular tunnelling ionization model MO-ADK theory the quantitative rescattering QRS model and the laser induced electronic diffraction LIED theory for probing the change of atomic configurations in a molecule. Highlighting the cutting edge developments in attosecond and strong field physics and identifying future opportunities and challenges this self contained text is invaluable for students and researchers in the field.

Ionization and Dissociation Dynamics of Molecules in Strong Laser Fields Wei Lai, 2016 The fast advancement of ultrashort pulsed high intensity laser technology allows for generating an electric field equivalent to the Coulomb field inside an atom or a molecule e.g. $E_c = 5.14 \times 10^9$ V/cm at the 1s orbit radius $a_0 = 0.0529$ nm of the hydrogen atom which corresponds to an intensity of 3.54×10^{16} W/cm². Atoms and molecules exposed in such a field will easily be ionized as the external field is strong enough to remove the electrons from the core. This is usually referred to strong field. Strong fields provide a new tool for studying the interaction of atoms and molecules with light in the nonlinear nonperturbative regime. During the past three decades significant progress has been made in the strong field science. Today most phenomena involving atoms in strong fields have been relatively well understood by the single active electron SAE approximation. However the interpretation of these responses in molecules has encountered great difficulties. Not like atoms that only undergo excitation and ionization various dissociation channels accompanying excitation and ionization can occur in molecules during the laser pulse interaction which imparts further

complexity to the study of molecules in strong fields Previous studies have shown that molecules can behave significantly different from rare gas atoms in phenomena as simple as single and double ionization Molecular dissociation following ionization also presents challenges in strong fields compared to what we have learned in the weak field regime This dissertation focuses on experimental studies on ionization and dissociation of some commonly seen small molecules in strong laser fields Previous work of molecules in strong fields will be briefly reviewed particularly on some open questions about multiple dissociation channels nonsequential double ionization enhanced ionization and molecular alignment The identification of various molecular dissociation channels by recent experimental technical upgrades will be shown The study of enhanced ionization in small molecules by time resolved pump probe experiments and varying pulse duration experiments will be discussed followed by an investigation of molecular alignment effect in sequential and nonsequential dynamics At last selective charge separation in charge asymmetric dissociation of heteronuclear diatomic molecules will be shown and conclusion and future work will be discussed Pages vii viii
