Models Of Information Processing In The Basal Ganglia Computational Neuroscience:

Models of Information Processing in the Basal Ganglia James C. Houk, Joel L. Davis, David G. Beiser, 1995 This book brings together the biology and computational features of the basal ganglia and their related cortical areas along with select examples of how this knowledge can be integrated into neural network models Recent years have seen a remarkable expansion of knowledge about the anatomical organization of the part of the brain known as the basal ganglia the signal processing that occurs in these structures and the many relations both to molecular mechanisms and to cognitive functions This book brings together the biology and computational features of the basal ganglia and their related cortical areas along with select examples of how this knowledge can be integrated into neural network models Organized in four parts fundamentals motor functions and working memories reward mechanisms and cognitive and memory operations the chapters present a unique admixture of theory cognitive psychology anatomy and both cellular and systems level physiology written by experts in each of these areas The editors have provided commentaries as a helpful guide to each part Many new discoveries about the biology of the basal ganglia are summarized and their impact on the computational role of the forebrain in the planning and control of complex motor behaviors discussed The various findings point toward an unexpected role for the basal ganglia in the contextual analysis of the environment and in the adaptive use of this information for the planning and execution of intelligent behaviors Parallels are explored between these findings and new connectionist approaches to difficult control problems in robotics and engineering Contributors James L Adams P Apicella Michael Arbib Dana H Ballard Andrew G Barto J Brian Burns Christopher I Connolly Peter F Dominey Richard P Dum John Gabrieli M Garcia Munoz Patricia S Goldman Rakic Ann M Graybiel P M Groves Mary M Hayhoe J R Hollerman George Houghton James C Houk Stephen Jackson Minoru Kimura A B Kirillov Rolf Kotter J C Linder T Ljungberg M S Manley M E Martone J Mirenowicz C D Myre Jeff Pelz Nathalie Picard R Romo S F Sawyer E Scarnat Wolfram Schultz Peter L Strick Charles J Wilson Jeff Wickens Donald J Woodward S J Young

Computational Models for Neuroscience Robert Hecht-Nielsen, Thomas McKenna, 2012-12-06 Formal study of neuroscience broadly defined has been underway for millennia For example writing 2 350 years ago Aristotle asserted that association of which he defined three specific varieties lies at the center of human cognition Over the past two centuries the simultaneous rapid advancements of technology and consequently per capita economic output have fueled an exponentially increasing effort in neuroscience research Today thanks to the accumulated efforts of hundreds of thousands of scientists we possess an enormous body of knowledge about the mind and brain Unfortunately much of this knowledge is in the form of isolated factoids In terms of big picture understanding surprisingly little progress has been made since Aristotle In some arenas we have probably suffered negative progress because certain neuroscience and neurophilosophy precepts have clouded our self knowledge causing us to become largely oblivious to some of the most profound and fundamental aspects of our nature such as the highly distinctive propensity of all higher mammals to automatically segment all aspects of

the world into distinct holistic objects and the massive reorganization of large portions of our brains that ensues when we encounter completely new environments and life situations At this epoch neuroscience is like a huge collection of small jagged jigsaw puzzle pieces piled in a mound in a large warehouse with neuroscientists going in and tossing more pieces onto the mound every month
