Siegfried Engelmann, Donald Steely, 2003-12-08 This ambitious highly theoretical book provides a capstone for the careers of
two very distinguished scholars It begins with an analysis of what functions and systems must exist for any organism or
machine to perform an unlearned act that is with an analysis of what must be wired into the organism or machine Once the
basics of unlearned responding have been established the authors then systematically show how learning mechanisms can be
layered onto that foundation in ways that account for the performance of new learned operations that eventually culminate in
the acquisition of higher order operations that involve concepts and language This work is of interest to various practitioners

Models of Human Memory provides an overview of the state of knowledge on human memory models. The book begins with an introductory chapter on the basic stages of the memory system and the historical roots of memory models. The remaining chapters are organized into five parts. Part I on memory systems covers topics such as a system for perception and memory, multi-trace strength theory of memory, and a model for postperceptual verbal memory that postulates a single memory store with multiple copies called replicas created in memory by rehearsal processes. Part II presents studies on phoneme storage and word recognition. Part III on memory for associations examines the storage-retrieval theory for the memorizing processes and presents a simple model of short-term memory (STM) for paired associates. Part IV on storage and retrieval mechanisms deals with mechanisms of repetition and rehearsal in short-term memory, models of recall and recognition, and memory search models. Part V presents a theory of human long-term associative memory and examines conceptual and methodological interactions between information processing, investigations of cognitive activity, and attempts to build models of memory.
