Modern Problems Computational Aerohydrodynamics:

Modern Problems in Computational Aerohydrodynamics DorodniCyn/Chus,1991-11-19 This book emphasizes the numerical methods of solving boundary problems for nonlinear equations of aerohydrodynamics especially partial differential and integro differential equations Topics discussed include an analysis of transonic gas flows and three dimensional supersonic flows the simulation of viscous fluid flows perturbation development in a boundary layer and approaches to constructing adaptive grids The book will appeal to professional aeronautical engineers applied physicists applied mathematicians and geophysicists Boundary Value Problems for Transonic Flow Alexander G Kuz'min,2003-02-28

Transonic flow occurs around moving objects as they approach and cross the sound barrier Serious problems can occur at this point such as shock induced flow separation which can cause the aircraft to spin out of control Another important practical problem is the achievement of higher aerodynamic performance of aircraft at cruise conditions which leads to considerable fuel savings The success in application of numerical methods for simulation of transonic flow and aircraft design depends on developments in the underlying mathematical theory This book presents a breakthrough in the solvability analysis of boundary value problems which makes it possible to establish convergence of finite element approximations for shock free flow and to provide a framework for putting the existing numerical methods on a more sound basis Also physical aspects concerned with patterns of formation and propagation of weak shock waves are analysed This contributes to the understanding of the extreme sensitivity of transonic flow to perturbation of freestream conditions The developed theoretical knowledge base yields promising concepts of the airfoil design and active flow control by airfoil wing shape modifications or suction blowing through a perforated surface Boundary Value Problems for Transonic Flow Focuses on Computational Fluid Dynamics Addresses practical problems such as airfoil design and flow control Presents developments made in the last two decades In essence this is a much needed monograph for researchers and engineers in applied mathematics and numerical analysis applied to aerodynamics and for algorithm developers in Computational Fluid Dynamics in the aircraft industry It gives design engineers the underlying mathematical theory necessary for developing new concepts for airfoil wing design and flow control **Mathematical Aspects of Numerical Solution of Hyperbolic Systems** A.G. Kulikovskii,N.V.

Pogorelov,A. Yu. Semenov,2000-12-21 This important new book sets forth a comprehensive description of various mathematical aspects of problems originating in numerical solution of hyperbolic systems of partial differential equations The authors present the material in the context of the important mechanical applications of such systems including the Euler equations of gas dynamics magnetohydrodynamics MHD shallow water and solid dynamics equations This treatment provides for the first time in book form a collection of recipes for applying higher order non oscillatory shock capturing schemes to MHD modelling of physical phenomena The authors also address a number of original nonclassical problems such as shock wave propagation in rods and composite materials ionization fronts in plasma and electromagnetic shock waves in magnets

They show that if a small scale higher order mathematical model results in oscillations of the discontinuity structure the variety of admissible discontinuities can exhibit disperse behavior including some with additional boundary conditions that do not follow from the hyperbolic conservation laws Nonclassical problems are accompanied by a multiple nonuniqueness of solutions The authors formulate several selection rules which in some cases easily allow a correct physically realizable choice This work systematizes methods for overcoming the difficulties inherent in the solution of hyperbolic systems Its unique focus on applications both traditional and new makes *Mathematical Aspects of Numerical Solution of Hyperbolic Systems* particularly valuable not only to those interested the development of numerical methods but to physicists and engineers who strive to solve increasingly complicated nonlinear equations

Smart Modeling for Engineering Systems Alena V. Favorskaya, Margarita N. Favorskaya, Sergey S. Simakov, Lakhmi C. Jain, 2019-01-08 This book highlights the work of several world class researchers on smart modeling of complex systems The contributions are grouped into the four main categories listed below Numerical schemes construction for the solution of partial differential equations Numerical methods in continuum media mechanics problems Mathematical modeling in aerodynamics plasma physics deformable body mechanics and geological hydrocarbon exploration Mathematical modeling in medical applications The book offers a valuable resource for theoreticians and application scientists and engineers as well as postgraduate students in the fields of computational methods numerical experiments parallel algorithms deformable solid bodies seismic stability seismic prospecting migration elastic and acoustic wave investigation gas dynamics astrophysics aerodynamics fluid dynamics turbulent flows hypersonic flows detonation waves composite materials fracture mechanics melting of metals mathematical economics medicine and biology
