Modulated Waves:

The Dynamics of Modulated Wave Trains A. Doelman, 2009 The authors investigate the dynamics of weakly modulated nonlinear wave trains For reaction diffusion systems and for the complex Ginzburg Landau equation they establish rigorously that slowly varying modulations of wave trains are well approximated by solutions to the Burgers equation over the natural time scale In addition to the validity of the Burgers equation they show that the viscous shock profiles in the Burgers equation for the wave number can be found as genuine modulated waves in the underlying reaction diffusion system In other words they establish the existence and stability of waves that are time periodic in appropriately moving coordinate frames which separate regions in physical space that are occupied by wave trains of different but almost identical wave number The speed of these shocks is determined by the Rankine Hugoniot condition where the flux is given by the nonlinear dispersion relation of the wave trains The group velocities of the wave trains in a frame moving with the interface are directed toward the interface Using pulse interaction theory the authors also consider similar shock profiles for wave trains with large wave number that is for an infinite sequence of widely separated pulses The results presented here are applied to the FitzHugh Nagumo equation and to hydrodynamic stability problems

Shore Wave Modulation Due to Infragravity Waves in the Nearshore Zone, with Applications Saad M. M. Abdelrahman, 1986 The omni present low frequency wave motion 30 300 sec contains a substantial fraction of the total wave energy inside the surf zone A more complete description of nearshore wave processes considers incident short period waves superposed on and interacting with long standing waves The wind waves are modulated in amplitude wavenumber and direction due to relatively slowly varying depth changes caused by the long waves The energy in the wind wave band is enhanced by side band growth at the sum and difference frequencies of short and long waves order 15% at the shoreline The modulation is identified in the analysis of field data as a positive correlation between the long waves and the wind wave envelope near the shoreline Considering oblique incident waves a steady longshore current showing a non vanishing current at the shoreline is found as a result of the non linear interaction between monochromatic incident and infragravity waves An analytical solution describing the unsteadiness of the longshore current is developed Keywords include Infragravity Longshore Current Sediment transport and Surf zone dynamics Theses

Structure And Dynamics Of Nonlinear Waves In Fluids: Proceedings Of The Iutam/isimm Symposium K Kirchgassner, Alexander Mielke, 1995-08-31 This symposium brought together mechanicians physicists and applied mathematicians to discuss the interdisciplinary topic of nonlinear wave motion which displays effects that give rise to a multitude of unanswered questions Nonlinear waves in fluids in particular display all the prominent nonlinear phenomena such as chaos turbulence and pattern formation Amongst the topics emphasized in these proceedings are travelling fronts solitary waves and periodic waves dissipative and conservative

temporal and spatial asymptotics of perturbations of waves bifurcations stability and local dynamics of waves interaction between different waves and between waves and the mean flow wave breaking nonlinear effects on focussing and diffraction modulation and envelope equations their derivation and validity and numerical and experimental results Oscillations, Waves and Acoustics P. K. Mittal, 2010 The present book is meant for the students of undergraduate Science and Engineering courses This course finds lots of applications right from Mechanics Sound Optics Solid State Physics Electrodynamics to Electronics The chapters cover a vast number of topics like free forced damped oscillations normal modes of vibrations sound waves overdamped and ballistic oscillations LCR circuits etc In every chapter the topics are dealt with in detail followed by illustrated solved examples and unsolved exercises Some previous experience with a Calculus course in which differential equations have been discussed is highly desirable However the details of the steps in arriving at final solutions are worked out in detail The book thus acts like any textbook and at the same time no help book is needed for further details **Waves and Oscillations in Plasmas** Hans L. Pecseli, 2020-05-05 Waves and Oscillations in Plasmas addresses central issues in modern plasma sciences within the context of general classical physics The book is working gradually from an introductory to an advanced level Addressing central issues in modern plasma sciences including linear and nonlinear wave phenomena this second edition has been fully updated and includes the latest developments in relevant fluid models as well as kinetic plasma models including a detailed discussion of for instance collisionless Landau damping linear as well as non linear The book is the result of many years of lecturing plasma sciences in Norway Denmark Germany and also at the United States of America Offering a clear separation of linear and nonlinear models the book can be tailored for students of varying levels of expertise in plasma physics in addition to areas as diverse as the space sciences laboratory experiments plasma processing and more Features Presents a simple physical interpretation of basic problems is presented where possible Supplies a complete summary of classical papers and textbooks placed in the proper context Includes worked examples exercises and problems with general applicability **The Electroencephalogram** John S. Barlow, 1993 Although the electroencephalogram discovered more than a century ago has been used for years as a non invasive diagnostic tool it is still poorly understood In this book John Barlow describes an ingenious new hypothesis for a comprehensive model of the EEG that is able to emulate a large variety of known EEG patterns with few variables In contrast to previous hypotheses and models which have treated only selected EEG patterns rhythmic activity such as alpha activity and sleep spindles seen largely as filtered noise or irregular activity or certain types of epileptiform activity such as spikes this approach which is based on an oscillator with two separate input modulations of the extremes and the slopes of waves covers all types of EEG patterns and stems from specific features of the EEG itself rather than from arbitrary signals Barlow describes the hypothesis in detail then tests predictions for normal and abnormal EEGs with the aid of a hardware model and with specially developed methods of analysis The hypothesis is further evaluated in the light of extensive reviews of other EEG models and methods of analysis

and of the underlying anatomy physiology and pathophysiology of cerebral electrical activity A technological section details the hardware model and the methodology for testing the hypothesis Appendixes present some new approaches to traditional methods of EEG analysis and artifact minimization areas in which Barlow has achieved international recognition John S Barlow M D is a Neurophysiologist in the Neurology Service at Massachusetts General Hospital Senior Research Associate in Neurology Neurophysiology at Harvard Medical School and a Research Affiliate in the Research Laboratory of Electronics at the Massachusetts Institute of Technology **Oscillations and Waves** M.I Rabinovich,D.I. Nonlinear Waves And Offshore Structures Cheung Hun Kim,2008-05-02 The responses of offshore structures are significantly affected by steep nonlinear waves currents and wind leading to phenomena such as springing and ringing of TLPs slow drift yaw motion of FPSOs and large oscillations of Spar platforms due to vortex shedding Research has brought about significant progress in this field over the past few decades and introduced us to increasingly involved concepts and their diverse applicability Thus an in depth understanding of steep nonlinear waves and their effects on the responses of offshore structures is essential for safe and effective designs This book deals with analyses of nonlinear problems encountered in the design of offshore structures as well as those that are of immediate practical interest to ocean engineers and designers It presents conclusions drawn from recent research pertinent to nonlinear waves and their effects on the responses of offshore structures Theories observations and analyses of laboratory and field experiments are expounded such that the nonlinear effects can be clearly visualized
