Molecular Biology Of Tumour Viruses:

The Molecular Biology of Tumour Viruses John Tooze, 1973 **Molecular Biology of RNA Tumor Viruses** John Stephenson, 2012-12-02 Molecular Biology of RNA Tumor Viruses deals with the molecular biology and biologic significance of RNA tumor viruses. Methods and procedures with broad application to diverse areas of molecular biology including cell culture procedures, competition radioimmunoassays, molecular hybridization, oligonucleotide mapping, heteroduplex mapping, and restriction endonuclease techniques are considered. This book is organized into 12 chapters and begins with a historical overview of tumor virology beginning with the early studies of Peyton Rous and leading up to the significant surge of activity during the later decade. The biology of endogenous retroviruses, their transmission both within and between species, and cellular regulatory factors influencing their expression are subsequently discussed. This book then addresses the nature and origin of transforming RNA viruses and gives a detailed review of knowledge concerning the genomic structure of type C viruses. Translational products encoded by the type C viral genome are examined in ensuing chapters, emphasizing the viral reverse transcriptase. Other mammalian retroviruses including the mouse mammary tumor virus and type D isolates of primates are also described. The book concludes by evaluating the possibility of direct etiologic involvement of either endogenous or exogenous RNA tumor viruses in human cancers. This book will be of value both to graduate students and to established investigators with specific interest in other aspects of molecular biology. **DNA Tumor Viruses** Blossom Damania, James Pipas, 2008-12-19 DNA Tumor Viruses will focus on the DNA viruses in the human population that are associated with cancers. *Mechanisms of DNA Tumor Virus Transformation* Leonard J. Rosenthal, 2001-01-01 Approximately 15% of human cancer incidence can be attributed to virus infection, i.e., viruses represent the second most important risk factor after tobacco consumption for cancer development in humans. Today five virus types are known to be involved in causing human cancer: papillomaviruses, retroviruses, herpesviruses, hepadnaviruses, and flaviviruses. This volume provides a comprehensive review of a number of DNA tumor viruses. Leading experts in the field of tumor virology discuss up-to-date information focusing on the transforming genes of DNA tumor viruses, the mechanisms of transformation, and the in vitro methodology used for their identification and characterization. In vitro studies have revealed several common mechanisms of viral transformation. Presented in a clear and concise manner, this book will be of value to students as well as researchers in the fields of general biology, molecular biology, cell biology, and microbiology. **Molecular Biology of Tumour Viruses**, 1981 Molecular Biology of Tumor Viruses: RNA tumor viruses John Tooze, 1981 **Human Oncogenic Viruses** Jing-hsiung James Ou, T. S. Benedict Yen, 2010 Viruses are the causes of approximately 25% of human cancers. Due to their importance in carcinogenesis, there is a desperate need for a book that discusses these viruses. This book is therefore timely, providing a comprehensive review of the molecular biology of oncogenic viruses and the cancers they cause. Viruses that are discussed in the individual chapters include hepatitis B virus, hepatitis C virus, human papilloma

viruses Epstein-Barr virus Kaposi's sarcoma virus and human T cell leukemia virus type 1 This book provides up to date information for graduate students postdoctoral fellows medical students physicians and non experts who are interested in learning more about the oncogenic viruses and how they cause human cancers

Small DNA Tumour Viruses Kevin Gaston, 2012 Small DNA tumor viruses are a fascinating group of double stranded DNA viruses made up of the polyomavirus the adenovirus and the papillomavirus families These viruses continue to provide fundamental insights into mammalian cell transformation cell cycle control and tumor formation The causal link between papillomaviruses and some human cancers is well known and a role for polyomavirus in human cancer has recently been established Adenoviruses do not cause cancer in humans but as well as providing excellent tools for the study of host cell processes these viruses have been exploited as delivery vehicles in gene therapy for diseases such as cystic fibrosis and cancer A common feature of small DNA tumor viruses is their heavy reliance on the host for survival and replication Understanding the virus host relationship is critical to understanding the tumorigenic process and how these viruses subvert the host's immune system In this timely book leading scientists from around the world review current hot topics in this area providing a fascinating overview of the molecular biology of these viruses and their interactions with the host The topics covered include HPV infections and the production of HPV virion stocks viral oncoproteins and their functions the replication and maintenance of viral genomes virus induced alterations in cellular miRNAs viral deregulation of DNA damage responses the initiation of viral DNA replication induction of genomic instability by viral oncoproteins targeting of PML proteins and PML nuclear bodies by these viruses adenoviruses and gene therapy The book will be essential reading for scientists and researchers working on small DNA tumor viruses and their associated diseases It is also a recommended text for anyone involved with DNA replication DNA damage responses and genome instability virus host interactions and viral tumorigenesis or antiviral drug development

Milestones in Current Research is a series of reprint collections distinguished from other such publications by new concepts in preparation presentation and intent The aim of each volume is to gather for a given field the seminal contributions that have defined and shaped the trends within the most active areas of current research The selections for each volume and the structure of the book have been determined with the help of a novel technique of bibliographic analysis and have then been presented to an acknowledged scientific authority for minor adjustments and the writing of an Introduction These introductions will lend historic perspective to the material selected for each volume The bibliographic analysis used tends to select papers central to the areas of current research within roughly the last decade and is a systematic procedure for depicting delineating and covering all such areas over a wide spectrum of scientific research It is hoped that with this procedure it will be possible to achieve an objectivity authority and thoroughness not reached by others and that the timeliness of the volumes will not be limited to just a few years Each volume should have the permanent value of a historical

statement and yet be sufficiently interesting to active researchers in the field as well as to students exploring the quiet way in which the relentless drama of research unfolds in the journal literature

We stand today on the threshold of a new understanding of cancer Primarily through the powerful tools of molecular biology unified hypotheses explaining the origins of the disease are emerging and rapidly being validated This volume which presents the latest findings from laboratories throughout the world on the role of RNA tumor viruses in cancer is a celebration of these achievements and a prediction of further progress leading ultimately to the control of the disease It is important in this context to recall the natural history or life cycle of RNA cancer virology From the earliest days of the science when viruses were first recognized as distinct biologic agents of etiologic significance their role in cancer was proposed and hotly debated The critical early discoveries even those made as recently as 25 years ago were met with rejection not skepticism or cautious restraint but outright rejection During the 60 s there was a gradual acceptance of the association between viruses and cancer the result of landmark studies in experimental systems and this led to a frenzy of activity in the field There followed another period of doubt and uncertainty due to the difficulty in attempting to apply directly and in retrospect inappropriately the tenets of infectious disease to human cancers only to have the field resurrected revitalized and redirected by the explosion of progress in molecular biology and genetics
