neurodegenerative diseases **Neurodegeneration and Prion Disease** David R. Brown,2005-07-26 David R Brown
Department of Biology and Biochemistry University of Bath Bath BA2 7AY UK In 1982 Stanley Prusiner and colleagues purified an abnormal protein from the brains of mice experimentally infected with a rare sheep disease called scrapie This protein was called the prion protein Earlier work had suggested that these diseases and others loosely collected together as transmissible spongiform encephalopathies TSEs were not transmitted by conventional infectious agents Prusiner suggested that this new protein was the infectious agent in these diseases Such a contentious suggestion led to a ferocious debate Many researchers still maintained that there was no such thing as an infectious protein despite this by 1990 most people accepted that the cause of the TSEs was the abnormal isoform of the prion protein his research group had identified The most convincing evidence for this had come from the work of Charles Weissmann whose prion protein knockout mice could not be infected because they lacked expression of the protein that was now forever linked to these diseases Since then it has become more widely accepted for these diseases to be termed prion diseases In 1997 when Stanley Prusiner won the Nobel Prize for his work on prion diseases Even then there was still an element of resistance in the scientific community It was considered that in order the transmissible agent to truly be a protein only the protein would have to be generated from a recombinant source **Rang & Dale's Pharmacology** James M.
