Molecular Structure Function And Assembly Of The Atp Synthases:

Molecular Structure, Function, and Assembly of the ATP Synthases Sangkot Marzuki, 2012-12-06 In recent years the ATP synthase H ATPase FoF₁ATPase has been the subject of intensive investigations in many laboratories. The major reason for this lies in the fact that this enzyme complex catalyses one of the most important reactions in living cells namely the synthesis of ATP utilizing the energy from an electrochemical transmembrane H⁺ gradient generated by the cellular respiratory chain or by the light reactions of photosynthetic organisms. The mechanism by which the H⁺ motive force is utilized to drive the synthesis of ATP is one of the major unsolved problems in biochemistry. Thus the fundamental information concerning the molecular structure and the mechanism of assembly of the ATP synthase is of major significance in cell biology. A seminar/workshop on the Molecular Structure Function and Assembly of the ATP synthases was held in April 1987 at the East West Center University of Hawaii Honolulu Hawaii to promote exchange of information between laboratories actively engaged in the study of the ATP synthases and to provide a forum for discussion and coordination of data derived from molecular genetic and biochemical approaches used in different laboratories. This volume summarizes the result of the seminar/workshop in the form of a collection of papers presented at the meeting and provides an overview of current work in this rapidly progressing area of research.

Protein Targeting to Mitochondria F.U. Hartl, 1997-02-24 A large number of newly synthesized polypeptides must cross one or several intracellular membranes to reach their functional locations in the eukaryotic cell. The mechanisms of protein trafficking in particular the post translational targeting and membrane translocation of proteins are of fundamental biological importance and are the focus of intensive research world wide. For more than 15 years mitochondria have served as the paradigm organelle system to study these processes. Although key questions such as how precisely proteins cross a membrane still remain to be answered exciting progress has been made in understanding the basic pathways of protein import into mitochondria and the components involved. In addition to a fascinating richness and complexity in detail the analysis of mitochondrial protein import has revealed mechanistic principles of general significance. Major discoveries include the demonstration of the requirement of an unfolded state for translocation and of the essential role of molecular chaperones on both sides of the membranes in maintaining a translocation competent conformation and in protein folding after import. It is becoming clear how a polypeptide chain is reeled across the membrane in an ATP dependent process by the functional cooperation of membrane proteins presumably constituting part of a transmembrane channel with peripheral components at the trans side of the membrane. In this volume eminent experts in the field take the time to review the central aspects of mitochondrial biogenesis. The logical order of the 16 chapters is

determined by the sequence of steps during protein import starting with the events taking place in the cytosol followed by the recognition of targeting signals the translocation of precursor proteins across the outer and inner membranes their proteolytic processing and intramitochondrial sorting and finally their folding and oligomeric assembly In addition the mechanisms involved in the export of mitochondrially encoded proteins as well as recent advances in understanding the division and inheritance of mitochondria will be discussed
