**Sedimentary Basins** Gerhard Einsele, 2013-06-29 The modern geological sciences are characterized by extraordinarily rapid progress as well as by the development and application of numerous new and refined methods most of them handling an enormous amount of data available from all the continents and oceans Given this state of affairs it seems inevitable that many students and professionals tend to become experts in relatively narrow fields and thereby are in danger of losing a broad view of current knowledge The abundance of new books and symposium volumes testifies to this trend toward specialization However many geological processes are complex and result from the interaction of many seemingly unrelated individual factors This signifies that we still need generalists who have the broad overview and are able to evaluate the great variety of factors and processes controlling a geological system such as a sedimentary basin In addition this also means that cooperation with other disciplines in the natural sciences and engineering is increasingly important Modern text books providing this broad overview of the earth sciences are rare Geology and Petrography of the Antarctic Continent Duncan Stewart, 1934 **Bibliography of North American Geology**, 1965 1919 28 cumulation includes material previously issued in the 1919 20 1935 36 issues and also material not published separately for 1927 28 1929 39 cumulation includes material previously issued in the 1929 30 1935 36 issues and also material for 1937 39 not published separately The United States Catalog Mary Burnham, Carol Hurd, 1928 Heavy Minerals Sergio Andò, 2021-09-09 The principal aim of this book is to provide a wide range of information and a useful reference for researchers interested to investigate heavy mineral assemblages in different geological settings and for a variety of purposes The methodological developments achieved in recent years for the identification of heavy minerals in a wide grain size range are illustrated All factors that affect heavy mineral concentration and relative proportions including hydraulic sorting mechanical abrasion chemical weathering and post depositional dissolution and all factors able to introduce analytical environmental or diagenetic bias are thoroughly addressed A proper integration of multiple techniques including bulk sediment multi mineral and single mineral methods are discussed by renowned authors in their invited contributions **Geological Survey Professional Paper**, 1975
