## Summary

Flagellated spores play important roles in the infection of plants and animals by many eukaryotic microbes. The oomycete *Phytophthora infestans*, which causes potato blight, expresses two phosphagen kinases (PKs). These enzymes store energy in taurocyamine, and are hypothesized to resolve spatial and temporal imbalances between rates of ATP creation and use in zoospores. A dimeric PK is found at low levels in vegetative mycelia, but high levels in ungerminated sporangia and zoospores. In contrast, a monomeric PK protein is at similar levels in all tissues, although is transcribed primarily in mycelia. Subcellular localization studies indicate that the monomeric PK is mitochondrial. In contrast, the dimeric PK is cytoplasmic in mycelia and sporangia but is retargeted to flagellar axonemes during zoosporogenesis. This supports a model in which PKs shuttle energy from mitochondria to and through flagella. Metabolite analysis indicates that deployment of the flagellar PK is coordinated with a large increase in taurocyamine, synthesized by sporulation-induced enzymes that were lost during the evolution of zoospore-lacking oomycetes. Thus, PK function is enabled by coordination of the transcriptional, metabolic and protein targeting machinery during the life cycle. Since plants lack PKs, the enzymes may be useful targets for inhibitors of oomycete plant pathogens.

## Introduction

The life cycles of many eukaryotic microbes include a zoospore stage, which is used for dissemination and host infection. Microbes producing these flagellated cells include apicomplexans, brown and green algae, excavates, foraminiferans, myxomycetes, oomycetes and others (Adl et al., 2005). Additional microbes such as alveolates form motile cilia, which are shorter forms of flagella. The movement of cilia and flagella is driven by dynein motors that hydrolyze adenosine triphosphate (ATP), which causes microtubule doublets to slide against each other (King and Sale, 2018). The resulting high rate of ATP use may lead to temporal or spatial mismatches between energy demand and availability.

Understanding how cells meet their energy needs is a major issue in biology. Most ATP in eukaryotes is generated in mitochondria and then diffuses across the cell to its sites of use. However, some cells may periodically use ATP faster than it can be made or transported. Cells cannot stockpile ATP since it must remain within a narrow concentration range to avoid misregulating cellular pathways. To circumvent this challenge, some cells have evolved to replenish ATP using enzymes, such as phosphagen kinases (PKs), which catalyze the reversible transfer of the  $\gamma$ -phosphoryl group of ATP to guanidino acceptors called phosphagens (Ellington, 2001; Wallimann et al., 2011). Most data on this come from studies of vertebrate cells such as muscle, brain and spermatozoa, although PKs have been also identified in bacteria, lower animals and eukaryotic microbes (Watts and Bannister, 1970; Ginger et al., 2008; Ooi et al., 2015). Some cells also use adenylate kinase to replenish ATP, which creates ATP and AMP from two molecules of ADP (Dzeja and Terzic, 2009). PKs and adenylate kinases may also help high-energy phosphoryls diffuse across cells or organelles by raising local concentration gradients in a 'bucket brigade' system (Dzeja and Terzic, 2009). PKs may also accelerate energy diffusion since phosphagens are smaller than ATP, and may relieve thermodynamic blocks to oxidative phosphorylation by siphoning off mitochondrial ATP (Ellington, 2001).

*Phosphagenkinases* S. N. Lyzlova, V. E. Stefanov, 1990-12-07 *Phosphagen Kinases* discusses phosphagen kinases and their substrates and demonstrates that the role of the phosphagen phosphagen kinase system is not limited to energy depositing functions. The book is unique in its complex biological, chemical, and physiological coverage of the family of related enzymes and phosphagen kinases. This book also emphasizes creatine and arginine kinases in the evolution of phosphagen kinases and provides information regarding biosynthesis, structure, physico-chemical properties, catalytic mechanisms, and the regulation of the enzymes. Other topics discussed include heterogeneity, intracellular localization, and developmental, physiological, and pathological changes of creatine kinase. Researchers and students specializing in biochemistry, enzymology, zoology, developmental biology, physiology, and medicine will find the book to be an invaluable source of information. *Creatine Kinase* Christian Vial, 2006 Creatine kinases and arginine kinases are an historical model in enzymology. They belong to the large family of phosphagen kinases which transfer a phosphoryl group from ATP to a nitrogen atom within a guanidinium group to form that was called by the early muscle physiologists a phosphagen. These compounds and the enzymes that catalyse their formation and use are present in cells with important and rapidly fluctuating energy requirements.

**Responses** J.M. Storey, K.B. Storey, 2000-07-31 *Cell and Molecular Responses to Stress* is a new multi volume book series from Elsevier Science that focuses on how organisms respond at a molecular level to environmental stresses imposed upon them. All organisms deal with variations in multiple environmental factors including temperature, oxygen, salinity, and water availability. Many show amazing tolerances to extreme stress with remarkable biochemical adaptations that allow life to persist under very difficult circumstances. This series explores the molecular mechanisms by which cells and organisms respond to stress focusing on the variations in metabolic response that allow some cells and organisms to deal with extreme

stress others to endure stress within strict limits and others to have a very low tolerance for changes in environmental parameters Articles from within the series highlight the elastic limits of molecular responses in Nature with examples drawn from animal plant and bacteria systems Volume 1 begins by considering some of the roles of environmental stress in determining the geographic distribution of animals and in promoting species divergence and then explores gene expression and metabolic responses to environmental stress with examples of adaptation to high and low temperature osmotic anoxia ischemia desiccation high pressure and heavy metal stresses *Creatine and Creatine Kinase in Health and Disease* Gajja S. Hochachka,2019-06-04 First published in 1994 this book explores the paradigm of muscles as molecular and metabolic machines in which all structures and functions are exquisitely integrated and matched to each other The analysis begins with a standard reductionist approach reviewing the integrated machine parts The key working components of the complete

muscle machine are proteins soluble organelle or membrane localized and a conservative count indicates that today more than 100 such machine parts are known essentially all occurring as cell specific isoforms Random assortment of these machine parts or protein isoforms could generate an astronomical number of muscle machines and an equally enormous number of muscle fiber types The question is why aren't such large numbers ever seen To attack this problem the reductionist approach is complemented with an integrationist adaptational one Evidence is presented that the more highly specialized the muscle type the further one moves from the above extreme in the most highly specialized muscles typically only one fiber type is found It is argued that instead of random assortment of isoforms or machine parts only specific and often unique combinations can work in appropriate fashion A few established examples of this fundamental principle are reviewed but emphasis is placed on the fact that we know dreadfully little about why this is so and what kinds of further studies are needed The issue of why the very large numbers of fiber types theoretically possible are never even approximately realized has never before been addressed Indeed it is rarely recognized *Muscles as Molecular and Metabolic Machines* is the first work of its kind on the subject *Cell and Muscle Motility* Jerry Shay, 2013-06-29 The term cytoskeleton in muscle and nonmuscle cells refers to fibrous proteins that are directly or indirectly associated with cell shape contractility and or motility These cytoskeletal elements include microtubules and associated proteins microfilaments and their binding proteins and lastly intermediate filaments Even though the structure and function of myosin and tropomyosin have been extensively investigated in muscle cells considerably less is known about their functions in nonmuscle cells they are often referred to generically as actin binding proteins as are actinin filamin vinculin and others Indeed most nonmuscle researchers are unaware that the term intermediate filament was derived from the observation that the diameter of intermediate filaments is intermediate between those of actin 5 nm and myosin 15 nm and not intermediate between those of actin 5 nm and microtubules 25 nm It has therefore been the purpose of this series to attempt to bridge the communication gap that appears to exist between muscle and nonmuscle researchers For those students and active scientists who are faced with the task of absorbing new data and concepts at an ever accelerating rate review essays are an excellent way to keep up The essays in this volume as well as in the previous ones focus on topics of current interest They are intended to be critical rather than exhaustive **The Enzymes**, 1973-07-04 *The Enzymes* **Molecular Aspects of Animal Development** Rudolf Weber, 2014-05-10 *The Biochemistry of Animal Development Volume III Molecular Aspects of Animal Development* provides an account of the developments in the molecular approach to vertebrate development with particular emphasis on the functions of nucleic acids The book discusses topics on oocyte maturation transcriptional patterns in early development the post transcriptional control of gene expression and the significance of gene amplification Morphogenetic substances growth promoting proteins and the functional differentiation of mitochondria in embryonic systems are covered as well Biochemists biologists and zoologists will find the book invaluable **Genomics of Plant-Associated Fungi and**
