NMR: Principles and Applications to Biomedical Research Jay W. Pettegrew, 2012-12-06 Nuclear magnetic resonance NMR is having an enormous impact on biomedical research both at the basic science and clinical levels In order to appreciate the elegance and power of this technology a historical perspective is in order In 1924 Pauli suggested that hydrogen nuclei might possess a magnetic moment This was in fact confirmed by Rabi in 1939 who demonstrated that a beam of hydrogen molecules in the presence of a magnetic field could be rotated by radio frequency fields resonating at the Larmor frequency The first successful NMR experiments in condensed matter were independently conducted in late 1945 by Purcell Torrey and Pound and by Bloch Hansen and Packard The Purcell group detected proton NMR in solid paraffin and the Bloch group detected proton in liquid water Bloch and Purcell received the Nobel Prize in physics in 1952 for these observations Until about 1952 studies of liquids and solids with broad resonance lines dominated the field of NMR However the reports of ^{31}P NMR chemical shifts in several compounds in 1949 by Knight of ^{14}N resonances in several ions by Proctor and Yu in 1950 and of ^{19}F resonances in several compounds in 1950 by Dickinson led to the development of high resolution NMR in liquids since the molecular motions in liquids result in very narrow lines compared to those in solids much smaller chemical shifts could be detected

Other Metal Coordination Compounds in Cancer Chemotherapy Stephen B. Howell, 2013-11-11 Taken together the data presented in this review and work by many other investigators support the notion that DNA excision repair is important in a tumor cell's resistance to platinum compounds. Inhibition of this repair system by combination chemotherapy with the excision repair inhibitors HU and Ara C produces synergistic cell kills and increased levels and persistence of DNA interstrand crosslinks. The studies with cis DDP and DDP in combination with UV induced thymine dimers suggest that there may be competition for DNA repair enzymes between the dimer and the platinum lesion. Whether the competing lesion is an intrastrand crosslink, interstrand crosslink, or platinum monoadduct, or all of these lesions cannot be determined. The similarity between an intrastrand crosslink and a cyclobutane dimer suggests that these lesions may compete for repair. However, the increased peak levels of interstrand crosslinks and increased persistence of these lesions at later time points suggest that this lesion may also be a substrate for the repair system. These observations may be of clinical relevance. Recently Dr Kathy Albain of our institution has completed a Phase III I study using a 12 hour pretreatment with HU and Ara C in patients prior to their cis DDP therapy. She observed a significant number of responders in this trial. 54 She is currently completing a second Phase III study substituting IV HU for the oral formulation. We anticipate initiating other clinical trials based upon these observations.
